1 | # Chart Generation Agent – System Prompt
2 |
3 | You are a chart specification generator for the Flint Chart rendering system. Your task is to convert a dataset and user intent into a valid ChartAssemblyInput specification.
4 |
5 | ## Flint ChartAssemblyInput Schema
6 |
7 | ```json
8 | {
9 |   "chartType": "string (e.g. 'Bar Chart', 'Line Chart')",
10 |   "encodings": {
11 |     "x": {"field": "column_name"},
12 |     "y": {"field": "column_name"},
13 |     "color": {"field": "column_name"}
14 |   },
15 |   "baseSize": {"width": 600, "height": 400},
16 |   "semantic_types": {
17 |     "column_name": "Category|Quantity|Temporal"
18 |   },
19 |   "data": {
20 |     "values": [...]
21 |   }
22 | }
23 | ```
24 |
25 | ## Chart Type Selection Rules
26 |
27 | 1. If the user explicitly asks for a chart type, use it
28 | 2. If there is a temporal field on x, prefer Line Chart or Area Chart
29 | 3. If there is one category and one quantity with <= 8 rows, consider Pie/Donut Chart
30 | 4. Default to Bar Chart for categorical comparisons
31 | 5. Use Scatter Chart for two quantitative fields
32 |
33 | ## Field Inference
34 |
35 | - Columns with text/names -> Category (map to x or color)
36 | - Columns with numbers -> Quantity (map to y or size)
37 | - Columns with dates -> Temporal (map to x)
38 |
39 | ## Output
40 |
41 | Return ONLY the JSON spec. No explanatory text.

```

.claude/prompts/narrative-system.md

28 lines · 1.3 KB

```
1 | # Narrative Generation Agent – System Prompt
2 |
3 | You are a data storyteller for a generative BI platform. Your task is to write a concise, insightful narrative paragraph explaining the key findings i
4 | n a dataset and its accompanying chart.
5 |
6 | ## Style
7 | - Professional but conversational – like a skilled data analyst talking to a business stakeholder
8 | - Lead with the most important finding
9 | - Use specific numbers, not vague terms like "many" or "large"
10 | - 3-5 sentences maximum
11 | - No bullet points – flowing prose
12 | - Include: what happened, why it matters, and one suggestion for action
13 |
14 | ## Context
15 |
16 | You receive:
17 | 1. The user's original question
18 | 2. A summary of the data (head of result set)
19 | 3. The chart type and key encodings
20 | 4. Any notable statistics (totals, averages, outliers, trends)
21 |
22 | ## Example
23 |
24 | **User question**: "How did our Q1 revenue compare to Q1 last year?"
25 | **Data summary**: Revenue grew from $2.1M to $2.8M, with Enterprise segment growing 45% while SMB was flat.
26 |
27 | **Output**:
28 | Revenue reached $2.8 million in Q1, a 33% increase over the same period last year. The growth was heavily concentrated in the Enterprise segment, whic
28 | h expanded 45% to $1.9 million, while SMB revenue remained essentially flat at $0.9 million. This suggests your upmarket strategy is working, but the
28 | SMB stall warrants attention.
```

.claude/prompts/nl2sql-system.md

33 lines · 1.1 KB

```
1 | # NL2SQL Agent – System Prompt
2 |
3 | You are an expert SQL query writer for a generative BI platform. Your task is to convert a user's natural language question into a valid, safe, read-only SQL query.
4 |
5 | ## Context Available
6 |
7 | You have access to:
8 | - **Schema context**: The most relevant tables and columns for this query, retrieved via semantic search
9 | - **Metric definitions**: Business metrics from the Cube.dev semantic layer
10 | - **Few-shot examples**: Similar queries that have been validated in the past
11 |
12 | ## Rules
13 |
14 | ### Always
15 | 1. Generate ONLY SELECT queries – never DROP, DELETE, TRUNCATE, UPDATE, INSERT, ALTER, CREATE
16 | 2. Use fully qualified table names: `schema_name.table_name`
17 | 3. Include tenant filter in every WHERE clause
18 | 4. Use parameterized values – never embed user input directly
19 | 5. Limit results: `LIMIT 1000` unless the user asks for more
20 | 6. Use CTEs (WITH clauses) for complex queries
21 |
22 | ### Output Format
23 |
24 | Return a JSON object with:
25 | ```json
26 | {
27 |   "sql": "SELECT ...",
28 |   "explanation": "This query...",
29 |   "tables_used": ["schema.table1"],
30 |   "assumptions": ["Assuming X means Y..."],
31 |   "warnings": []
32 | }
33 | ```
```

.claude/prompts/report-planner-system.md

36 lines · 1.6 KB

```

1 | # Report Planner
2 |
3 | You plan multi-section analytical reports from a natural language request. You do NOT write SQL or prose – you only choose metrics from the provided c
4 | atalog and give each section a short title.
5 |
6 | ## Input
7 |
8 | You receive:
9 | - **Report request**: the user's natural language description of the report they want
10 | - **Available Metrics**: the semantic layer catalog (metric names like `Sales.revenue_total`, their types, descriptions, and dimensions)
11 |
12 | ## Output
13 |
14 | Respond with ONLY a JSON object (no markdown fences, no commentary):
15 |
16 | ```json
17 | {
18 |   "title": "Short report title (max 80 chars)",
19 |   "sections": [
20 |     {
21 |       "metric": "Cube.MeasureName from the catalog – exact match required",
22 |       "title": "Section heading (max 100 chars)",
23 |       "dimension": "A dimension of that metric to slice by (omit for a single total)",
24 |       "granularity": "month|day – only when the dimension is a time dimension"
25 |     }
26 |   ]
27 | }
28 | ```
29 |
30 | ## Rules
31 |
32 | 1. Pick between 2 and 4 sections that together cover the request. Fewer, well-chosen metrics beat more, redundant ones.
33 | 2. `metric` MUST be an exact name from the catalog. Never invent or pluralize metric names.
34 | 3. Prefer slicing by a categorical dimension (region, category, stage, country...) unless the request implies a trend – then use a time dimension with
35 |    "month".
36 | 4. Section titles are human-readable ("Revenue by Region", not "sales_revenue_total").
37 | 5. If the request mentions specific metrics, use them first; fill remaining sections with complementary metrics from the catalog.
38 | 6. If the catalog has fewer metrics than sections requested, use what exists – never repeat a metric across sections.

```

.claude/rules/api-design.md

34 lines · 1.0 KB

```
1 | # API Design Standards
2 |
3 | ## Route conventions
4 |
5 | - ALL API routes are versioned under `/api/v1/`
6 | - Route files are `snake_case.py` in `backend/app/api/v1/`
7 |
8 | ## Request/Response schema
9 |
10 | - Every request body is a Pydantic v2 model with `extra="forbid"`
11 | - Every response body is a Pydantic v2 model
12 | - Error responses use: `{"detail": {"code": "ERROR_CODE", "message": "Human-readable message"}}`
13 |
14 | ## Async everywhere
15 |
16 | - All FastAPI route handlers are `async def`
17 | - All DB calls use async SQLAlchemy (`async_session` with `asyncpg`)
18 |
19 | ## Dependency injection
20 |
21 | - Auth/session/db always via FastAPI `Depends()` – never instantiated in route body
22 | - `user: dict = Depends(get_current_user)` for auth
23 | - `db: AsyncSession = Depends(get_db)` for database
24 |
25 | ## Streaming
26 |
27 | - SSE endpoints return `StreamingResponse` with `media_type` `text/event-stream`
28 | - Each event is: `data: {json}\n\n`
29 |
30 | ## CORS
31 |
32 | - Configured via `settings.CORS_ORIGINS`
33 | - In development: `["http://localhost:3000"]`
34 | - In production: strict origin list
```

.claude/rules/llm-patterns.md

35 lines · 1.2 KB

```
1 | # LLM Prompt Engineering Conventions
2 |
3 | ## Model selection
4 |
5 | - Use `settings.LLM_REASONING_MODEL` (claude-opus-4) for SQL generation, complex reasoning
6 | - Use `settings.LLM_FAST_MODEL` (claude-haiku-4) for intent classification, chart specs, narratives
7 | - NEVER hardcode model names in business logic
8 |
9 | ## Prompt template management
10 |
11 | - Prompt templates are versioned files in `.claude/prompts/`
12 | - Load templates with `load_prompt("prompt_name")` - never inline long prompts
13 | - Templates use `{variable}` substitution with Pydantic validation
14 |
15 | ## Schema context compression
16 |
17 | - Embed only relevant table/column metadata into LLM context
18 | - Use pgvector cosine similarity to retrieve top-k relevant tables
19 | - Never send the full database schema to the LLM
20 | - Include column descriptions from dbt schema.yml in the context
21 |
22 | ## Chain of thought
23 |
24 | - Reasoning models (opus-4) always use `thinking` blocks for SQL generation
25 | - Fast models (haiku-4) use direct generation
26 |
27 | ## Error handling
28 |
29 | - LLM calls always go through `llm_client.py` which handles timeout + retry, token budgets, and latency tracking
30 |
31 | ## Few-shot examples
32 |
33 | - Stored in `backend/app/agents/examples/` as JSON files
34 | - Load dynamically based on query similarity via pgvector
35 | - Never hardcode examples in source code
```

.claude/rules/sql-safety.md

31 lines · 1.2 KB

```
1 | # SQL Safety Rules
2 |
3 | ## NEVER generate destructive SQL
4 |
5 | All database access through the query engine is READ-ONLY. The following operations are forbidden:
6 |
7 | - `DROP TABLE`, `DROP DATABASE`, `DROP SCHEMA`, `DROP INDEX`
8 | - `DELETE FROM`, `TRUNCATE TABLE`
9 | - `ALTER TABLE DROP COLUMN`, `ALTER TABLE RENAME`
10 | - `UPDATE` (unless through explicit service methods with authorization)
11 | - `INSERT` (unless through explicit service methods with authorization)
12 | - `CREATE USER`, `GRANT`, `REVOKE`
13 | - `COPY` (export/import)
14 | - Any multi-statement queries (separated by `;`)
15 |
16 | ## Always use parameterized queries
17 |
18 | - NEVER concatenate user input into SQL strings
19 | - Use SQLAlchemy parameterized queries: `select().where(table.c.name == bindparam("name"))`
20 | - Raw SQL only through `text()` with explicit bind parameters
21 |
22 | ## Timeout enforcement
23 |
24 | - All analytical queries are capped at 30s via `SET statement_timeout = '30s'`
25 | - The ValidationAgent injects this before every query execution
26 |
27 | ## ValidationAgent must run before every SQL execution
28 |
29 | - The ValidationAgent checks for destructive patterns
30 | - It runs a dry-run EXPLAIN plan for cost estimation
31 | - Queries that would scan > 1M rows require explicit user confirmation
```

.claude/skills/flint-chart/scripts/test-flint.sh

15 lines · 0.4 KB

```

.claude/skills/flint-chart/SKILL.md

84 lines · 2.6 KB

```

1 | # Flint Chart – Agent Skill
2 |
3 | ## When to use this skill
4 |
5 | Use Flint Chart when the user requests any of the following:
6 | - A chart or visualization ("make a chart", "visualize this", "plot the data")
7 | - A graph, diagram, or data graphic
8 | - A report that includes charts
9 | - PNG or SVG export of a visualization
10 | - A static chart for embedding in a document, email, or dashboard tile
11 |
12 | Do NOT use Flint Chart for interactive dashboard widgets where hover/zoom/brush is needed – those use the GPT-Vis protocol with AntV G2.
13 |
14 | ## Flint ChartAssemblyInput Schema
15 |
16 | Flint uses a single unified schema for approximately 40 chart types across three backends (Vega-Lite, ECharts, Chart.js).
17 |
18 | ### Required fields
19 |
20 | ```json
21 | {
22 |   "chartType": "Bar Chart",
23 |   "data": {
24 |     "values": [
25 |       {"x_field": "value", "y_field": 123}
26 |     ]
27 |   }
28 | }
29 | ```
30 |
31 | ### Full schema
32 |
33 | ```json
34 | {
35 |   "chartType": "Bar Chart",
36 |   "encodings": {
37 |     "x": {"field": "column_name"},
38 |     "y": {"field": "column_name"},
39 |     "color": {"field": "column_name"},
40 |     "size": {"field": "column_name"}
41 |   },
42 |   "baseSize": {"width": 600, "height": 400},
43 |   "semantic_types": {
44 |     "column_name": "Category",
45 |     "other_column": "Quantity",
46 |     "date_column": "Temporal"
47 |   },
48 |   "data": {
49 |     "values": [...]
50 |   }
51 | }
52 | ```
53 |
54 | ### Supported Chart Types
55 |
56 | **Categorical**: Bar Chart, Stacked Bar Chart, Grouped Bar Chart, Pie Chart, Donut Chart
57 | **Trend/Temporal**: Line Chart, Multi-series Line Chart, Area Chart, Stacked Area Chart
58 | **Distribution**: Histogram, Box Plot, Scatter Chart
59 | **Relational**: Heatmap, Bubble Chart
60 |
61 | ### Semantic Types
62 |
63 | - `Category` – discrete labels (names, regions, IDs)
64 | - `Quantity` – continuous numeric values (revenue, counts, percentages)
65 | - `Temporal` – dates, timestamps, years
66 |
67 | ### Backend Selection
68 |
69 | - **Vega-Lite** (recommended): Best for SVG output, typography, and complex statistical charts
70 | - **ECharts**: More chart types (Sankey, radar, treemap), better for Asian character rendering
71 | - **Chart.js**: Fastest rendering, PNG only, good for simple dashboards
72 |
73 | ### Data Format
74 |
75 | Prefer `data.values` for small datasets (< 100 rows). For larger datasets, write to a temp file in `FLINT_MCP_DATA_ROOTS` and reference via `data.url`
76 |
77 | ## Integration with GenBI Pipeline
78 |
79 | 1. The NL2SQL agent generates a SQL query from the user's natural language
80 | 2. The SQL is executed against the data source, producing a result set
81 | 3. The ChartGenAgent analyzes the result set, infers semantic types, and selects a chart type
82 | 4. The ChartGenAgent produces a `ChartAssemblyInput` spec
83 | 5. The FlintChartBridge renders the spec via Flint MCP
84 | 6. The result (PNG/SVG) is embedded in the chat response

1| """Flint Chart integration module for GenBI.
2|
3| This module bridges GenBI's agent pipeline to Microsoft Flint Chart MCP,
4| providing chart rendering via a unified ChartAssemblyInput spec that compiles
5| to Vega-Lite, ECharts, or Chart.js.
6|
7| Architecture:
8|   GenBI Agent Pipeline
9|     → ChartGenAgent produces ChartAssemblyInput spec
10|      → FlintChartBridge (this module) calls Flint MCP
11|       → Flint MCP server compiles & renders locally
12|        → Returns PNG/SVG inline
13|
14| The bridge also supports:
15| - AWEL operator integration (FlintChartOperator for workflow canvas)
16| - vis-flint protocol for embedding charts in chat responses
17| - Backend selection per-render (Vega-Lite for SVG, ECharts for complex, Chart.js for speed)
18| """

```

1 | """FlintChartOperator – AWEL-compatible operator for the Flow Canvas.
2 |
3 | This operator wraps FlintChartBridge into a reusable DAG node that can be
4 | dropped into DB-GPT-style visual workflows. It:
5 |
6 | 1. Accepts a DataFrame from a preceding SQL execution operator
7 | 2. Introspects column types and suggests chart type + encodings
8 | 3. Generates a ChartAssemblyInput spec via LLM (if needed)
9 | 4. Renders the chart via FlintChartBridge
10 | 5. Returns a ChartResult (PNG/SVG) to downstream operators
11 |
12 | The operator is designed to follow DB-GPT's AWEL MapOperator pattern
13 | so it can be registered on the Flow Canvas alongside existing operators.

backend/app/agents/chart/vis_flint_protocol.py

124 lines · 3.8 KB

```

1 | """vis-flint protocol handler – extends the GPT-Vis protocol for Flint charts.
2 |
3 | DB-GPT's GPT-Vis protocol uses markdown code blocks with language identifiers
4 | like ``vis-dashboard`` and ``vis_chart`` that the frontend dispatches to
5 | AntV G2 components.
6 |
7 | This module extends that protocol with a new ``vis-flint`` block type that
8 | routes to Flint MCP for rendering. The frontend can embed the resulting
9 | PNG/SVG alongside interactive G2 charts.
10 |
11 | Usage in agent response:
12 | ``vis-flint
13 | {
14 |   "chartType": "Bar Chart",
15 |   "encodings": {
16 |     "x": {"field": "region"},
17 |     "y": {"field": "revenue"}
18 |   },
19 |   "data": {
20 |     "values": [...]
21 |   }
22 | }
23 | ...
24 |
25 | The backend chat pipeline detects these blocks, renders them via Flint,
26 | and replaces them with inline base64 images or SVG markup.
27 | """

1 | """Chart hallucination detection and correction.
2 |
3 | Deterministic validation of LLM-generated chart specifications against
4 | the underlying data. Catches common LLM hallucination modes:
5 |
6 | 1. **Field hallucination**: spec references columns that don't exist in data
7 | 2. **Type mismatch**: chart type requires encodings that the data can't satisfy
8 |   (e.g., Pie Chart with quantitative x-axis, Line Chart with no temporal data)
9 | 3. **Data range hallucination**: axis values imply impossibilities
10 |   (e.g., negative revenue, dates in the future, percentages > 100%)
11 | 4. **Aggregate mismatch**: chart implies aggregation that doesn't match data
12 |   (e.g., bar chart shows 5 bars but data has 3 categories)
13 | 5. **Empty/null data**: chart spec doesn't handle missing values
14 | 6. **Structurally invalid**: malformed Vega-Lite spec that would fail to render
15 |
16 | Correction strategies:
17 |   - Field mismatch → rewrite encoding field names from available columns
18 |   - Type mismatch → downgrade to a compatible chart type
19 |   - Range issues → adjust axis bounds to data min/max
20 |   - Structural issues → rebuild with safe defaults
21 |
22 | Design principle: The validator should NEVER reject a chart outright unless
23 | the data is completely unplotable. Prefer correction over rejection.

```

1 | """ValidationAgent – SQL safety gate before execution.
2 |
3 | This agent runs deterministically (no LLM call) on every generated SQL query
4 | before it's executed against a data source. It checks:
5 |
6 | 1. Destructive pattern detection (DROP, DELETE, TRUNCATE, etc.)
7 | 2. Read-only enforcement (only SELECT statements)
8 | 3. Dry-run EXPLAIN plan for cost estimation
9 | 4. Row count limits (>1M rows requires user confirmation)
10 | 5. Statement-timeout policy reporting (the actual `SET LOCAL statement_timeout`
11 |    is enforced by the connector at execution time – see PostgreSQLConnector)
12 | 6. Multi-statement detection (prevents `;` injection attacks)
13 |
14 | The agent is a *safety gate*: it returns the validated SQL plus metadata. It
15 | deliberately does NOT mutate the SQL to inject `SET LOCAL` – that is the
16 | connector's responsibility (the single point of execution), so the same
17 | timeout/read-only enforcement applies to every code path that hits the
18 | database, not just the ones that remembered to call the validator.
19 |
20 | IMPORTANT: This file is in the DO NOT MODIFY (Protected) list in CLAUDE.md.
21 | Any relaxation of safety rules requires explicit approval and security review.
22 | """

```

1  """
2  PostgreSQL connector implementation – asyncpg-backed, read-only enforced.
3
4  This connector implements BaseConnector for PostgreSQL with:
5
6  - Read-only transaction enforcement (SET TRANSACTION READ ONLY)
7  - 30-second statement_timeout injection
8  - Parameterized query support via asyncpg
9  - Schema metadata retrieval (tables, columns, types, descriptions)
10 - Connection pooling via SQLAlchemy async engine
11 - Destructive SQL blocking at the driver level
12
13 Usage:
14     connector = PostgreSQLConnector(connection_url="postgresql+asyncpg://...")
15     await connector.connect()
16     results = await connector.execute("SELECT region, SUM(revenue) FROM sales GROUP BY region")
17     schema = await connector.get_schema()
18     await connector.disconnect()
19 """

```

1 | """Redis caching layer – schema, metrics, and query results.
2 |
3 | Centralized caching strategy for the GenBI platform. Every cacheable entity
4 | routes through this module with consistent TTL policies and cache invalidation.
5 |
6 | Cache tiers:
7 |   Level 1: In-memory LRU (sub-millisecond, per-process, 1000-entry max)
8 |   Level 2: Redis (millisecond, shared across workers, persistent)
9 |
10 | What's cached:
11 |   - Schema embeddings (TTL: 24h – only changes on nightly sync)
12 |   - Metric definitions (TTL: 5min – Cube.dev /meta)
13 |   - Query results (TTL: 5min – read-heavy analytics)
14 |   - LLM response cache (TTL: 1h – same query/schema = same SQL)
15 |   - Rate limit counters (TTL: window-based)
16 |   - Session state (TTL: 30min idle)
17 |
18 | Cache keys are namespaced: genbi:{tenant_id}:{entity_type}:{hash}
19 |
20 | Usage:
21 |     cache = get_cache()
22 |
23 |     # Schema
24 |     schema = await cache.get_schema_context(query, tenant_id)
25 |     await cache.set_schema_context(query, tenant_id, schema)
26 |
27 |     # Metrics
28 |     metrics = await cache.get_metric_definitions(tenant_id)
29 |     await cache.set_metric_definitions(tenant_id, metrics)
30 |
31 |     # Query results
32 |     result = await cache.get_query_result(sql_hash, tenant_id)
33 |     await cache.set_query_result(sql_hash, tenant_id, rows)
34 |
35 |     # Invalidate
36 |     await cache.invalidate_tenant(tenant_id)
37 |     await cache.invalidate_schema(tenant_id)

1 | """PII masking – column-level data protection for query results.
2 |
3 | Applies masking rules to sensitive fields before data reaches agents or the
4 | frontend. Masks are configurable per-tenant via database settings.
5 |
6 | Supported mask types:
7 | - EMAIL: j***@company.com
8 | - PHONE: ***-***-1234
9 | - SSN: ***-**-1234
10 | - CREDIT_CARD: ****-****-****-1234
11 | - FULL_MASK: ****
12 | - CUSTOM: regex-based pattern replacement
13 |
14 | Architecture:
15 |   Query Result → PII Masking Middleware → Agent Pipeline → Frontend
16 |
17 | The masking happens at the service layer between data retrieval and the
18 | agent pipeline, so no PII ever enters LLM context.

1 | """Apache AGE graph database – data lineage and relationship analysis.
2 |
3 | Apache AGE (A Graph Extension) is a PostgreSQL extension that provides
4 | graph database capabilities via openCypher queries. GenBI uses it for:
5 |
6 | 1. Data lineage: tracking where metrics come from (source table → Cube measure)
7 | 2. Relationship analysis: discovering join paths between tables for SQL generation
8 | 3. Impact analysis: what downstream assets are affected by a schema change
9 |
10 | Architecture:
11 |   Schema Catalog → Graph Ingestion → AGE Graph (genbi_graph)
12 |                      ↓
13 |   LineageAgent ← openCypher queries ← AGE
14 |                      ↓
15 |   Graph context injected into NL2SQLAgent (join paths)
16 |
17 | Every cypher statement is a complete inline literal with AGE parameter
18 | binding (``$name`` placeholders inside the ``$$`` body; values ride in the
19 | third ``ag_catalog.cypher`` argument, bound via the ``:params`` SQLAlchemy
20 | named parameter) – never string-interpolated.

263 lines · 9.5 KB

```

1 | """baseline schema - mirrors infra/postgres/init.sql.
2 |
3 | Revision ID: 0001_baseline
4 | Revises:
5 | Create Date: 2026-08-05
6 |
7 | This migration is the Alembic mirror of the schema that init.sql creates on
8 | first Docker boot. Two equally valid paths to a schema'd database:
9 |
10 | 1. Docker entrypoint (init.sql) - applies on container creation, then this
11 | migration is a no-op because every CREATE uses IF NOT EXISTS.
12 | 2. Pure Alembic (fresh DB, no init.sql) - this migration creates everything.
13 |
14 | After this baseline, ALL schema changes go through Alembic only (no edits to
15 | init.sql). See docs/adr/005-age-and-pgvector-image.md.
16 | """

```

1 | """app roles + enforced RLS – runtime no longer connects as superuser.
2 |
3 | Revision ID: 0002_app_roles
4 | Revises: 0001_baseline
5 | Create Date: 2026-08-15
6 |
7 | Before this migration the backend connected as POSTGRES_USER (a superuser),
8 | so every FORCE ROW LEVEL SECURITY policy was silently bypassed – tenant
9 | isolation was configured but never enforced. This migration introduces two
10 | non-superuser LOGIN roles and the grants/policies they need:
11 |
12 | - genbi_app – runtime role (ORM engine + query connector). Bound by the
13 |   tenant_isolation policies via the 'app.current_tenant_id' GUC the
14 |   connector already sets per transaction.
15 | - genbi_auth – login-only role. Reads the 'users' table across tenants
16 |   (credential lookup requires it); a permissive policy is scoped TO this
17 |   role and nothing else is granted to it.
18 |
19 | It also grants the runtime role access to existing tables via default
20 | privileges. RLS enrollment of the analytics tables lives in 0003_analytics
21 | (which creates them). See docs/adr/006-enforced-rls-roles.md.
22 |
23 | Passwords are fixed dev defaults, consistent with infra/postgres/init.sql
24 | and scripts/gen-env.sh. Rotate in production (see README security section).

3| Revision ID: 0003_analytics
4| Revises: 0002_app_roles
5| Create Date: 2026-08-15
6|
7| Creates the 10 synthetic analytics tables used by the demo/seed dataset
8| (scripts/seed_test_data.py fills them; it no longer performs DDL). Every
9| table carries tenant_id and gets the same FORCE RLS + tenant_isolation
10| policy as the metadata tables, so the genbi_app runtime role is tenant-
11| scoped on analytics queries too – the connector already sets the
12| `app.current_tenant_id` GUC per transaction.
13|
14| Note: `web_users` (was `users`) was renamed to stop shadowing the RLS-
15| enrolled app-login table of the same name in the public schema.
16|
17| Statements use IF NOT EXISTS / IF EXISTS so this converges on databases
18| where earlier seed-script DDL already ran. RLS enrollment and teardown use
19| literal DO blocks with %I identifier quoting (identifiers cannot be bound
20| as parameters).

1 | """Cube.dev semantic layer client.
2 |
3 | Connects GenBI's agent pipeline to the Cube.dev metrics API, the single
4 | source of truth for all business metric definitions. Every metric-aware
5 | feature in GenBI routes through this client:
6 |
7 | - NL2SQLAgent: resolves metric names to underlying SQL dimensions/measures
8 | - ChartGenAgent: retrieves metric metadata for axis label formatting
9 | - API routes (/api/v1/metrics): lists metrics and executes metric queries
10 |
11 | Cube.dev exposes two primary APIs:
12 | - REST API (legacy): POST /cubejs-api/v1/load for queries, /meta for schema
13 | - GraphQL API (v2): richer query semantics, recommended path
14 |
15 | This client uses the REST API for maximum compatibility and adds GraphQL
16 | support as an optional upgrade path.
17 |
18 | Architecture:
19 |   Agent Pipeline → CubeClient.get_metric("revenue_total")
20 |     → Cache check (Redis, TTL 5min)
21 |     → Cache miss: HTTP POST to Cube REST API
22 |     → Cache hit: return cached definition
23 |     → Format for LLM context injection
24 |
25 | Metrics are NEVER re-implemented in agent code – always query via this client.

```

1 | """Audit writer – persists the per-LLM-call governance trail to audit_log.
2 |
3 | Registered as the LLMClient audit callback at app startup (main.create_app):
4 | every successful LLM invocation in the pipeline (router, nl2sql, chart,
5 | narrative) lands one audit_log row with real token counts, latency, model
6 | name, and any generated SQL – the “every LLM call produces an AuditLog
7 | entry” contract from docs/architecture-overview.md, and agent-granularity
8 | tracing per ADR 002.
9 |
10 | Writes go through a dedicated asyncpg connection on the RLS-bound runtime
11 | role (genbi_app) with the tenant GUC set per row – the same isolation
12 | pattern as the rest of the app (ADR 006). Rows whose ids are not UUIDs
13 | (the client’s “unknown”/“default” fallbacks) are skipped: better a missing
14 | row than a broken chat response.
15 |
16 | Everything FAILS OPEN: audit problems are logged, never raised – an audit
17 | outage must not take down the pipeline (docs/core-services.md).

1 | """Conversation persistence – multi-turn chat history (Phase 14).
2 |
3 | Reads and writes go through dedicated asyncpg connections on the RLS-bound
4 | runtime role (genbi_app) with the tenant GUC set per connection – the same
5 | isolation pattern as the audit writer (Phase 12). Per-user scoping beyond
6 | RLS (a tenant's users only see their own conversations) is enforced with
7 | explicit parameterized predicates.
8 |
9 | Failure semantics:
10 | - writes (create/append) FAIL OPEN – persistence problems never break a chat
11 |   response; the caller falls back to an in-memory conversation id.
12 | - reads RAISE – callers decide (ChatService history: fail-open to []); the
13 |   conversations API maps failures to 503).

```

1 | """Report generation and persistence – multi-chart reports (Phase 16).
2 |
3 | Pipeline (LLM-planned, deterministic execution – 2 LLM calls per report):
4 | 1. Plan: one fast-model call over the metric catalog picks 2-4 sections
5 |   (metric + slice dimension + title). Fail → REPORT_GENERATION_FAILED.
6 | 2. Execute per section (fail-open): tenant-scoped Cube query →
7 |   deterministic ChartAssemblyInput → FlintChartBridge SVG render.
8 | 3. Summarize: one fast-model call over all section results.
9 |
10 | Persistence follows the conversations.py pattern: asyncpg on the RLS-bound
11 | runtime role with the tenant GUC per connection. Writes fail open (the
12 | generated report returns even if persistence fails – with a warning);
13 | reads raise so the API can map to 503/404.

1 | # GenBI Backend
2 |
3 | FastAPI application providing the Generative BI API.
4 |
5 | ## Architecture
6 |
7 | Four-layer design:
8 | ```
9 |
10 | Interface (FastAPI routes)
11 |   → Orchestration (LangGraph agents: NL2SQL, Chart, Narrative, Router, Validation)
12 |   → Semantic Layer (Cube.dev metrics API + dbt schema catalog)
13 |   → Data Retrieval (SQLAlchemy connectors to PostgreSQL, Snowflake, etc.)
14 | ```
15 |
16 | ## Key Modules
17 |
18 | - `app/agents/` - LangGraph agent definitions (NL2SQL, ChartGen, Narrative, Router, Validation)
19 | - `app/agents/chart/` - Flint Chart MCP integration (FlintChartOperator, vis-flint protocol)
20 | - `app/semantic/` - Cube.dev client, schema embedding, metric resolution
21 | - `app/connectors/` - SQLAlchemy database connectors with read-only enforcement
22 | - `app/services/` - Business logic: query execution, chart generation, report assembly
23 | - `app/models/` - Pydantic v2 request/response schemas
24 | - `app/db/` - SQLAlchemy ORM models, Alembic migrations
25 | - `app/core/` - Config, auth, JWT, RBAC, logging, middleware
26 |
27 | ## Quick Start
28 |
29 | ```bash
30 | uv run uvicorn app.main:app --reload --port 8000
31 | uv run pytest tests/ -v -m "not e2e"
32 | uv run alembic upgrade head
33 | ```

```

1 | """Tenant isolation tests – the crown jewels of Phase 8b.
2 |
3 | These tests prove that RLS is actually ENFORCED at the database layer:
4 | the runtime role (genbi_app) sees only rows matching its tenant GUC, the
5 | login role (genbi_auth) can read users but nothing else, and analytics
6 | tables are tenant-scoped just like the metadata tables.
7 |
8 | They connect with the real roles created by Alembic 0002 (dev default
9 | passwords; overridable via GENBI_APP_DB_PASSWORD / GENBI_AUTH_DB_PASSWORD).
10 | CI runs them against its service container after the migration step.

1 | """Golden NL2SQL evaluation suite runner.
2 |
3 | Evaluates the NL2SQLAgent against a golden dataset of 20 NL/SQL pairs.
4 | Must achieve >=90% accuracy before any merge to main.
5 |
6 | Accuracy is measured across three tolerance levels:
7 | - exact: SQL string identical after normalization
8 | - fuzzy: Same tables used, same output columns, same aggregation logic
9 | - semantic: Query intent matches (for complex queries with window functions)
10 |
11 | Usage:
12 |   uv run pytest tests/evals/ -v --tb=short # run with test harness
13 |   uv run python tests/evals/run_eval.py    # standalone runner
14 | """

1 | # Generative BI Platform – Project Context
2 |
3 | > **Owner:** Iven Kwan | **Stack Tier:** Enterprise | **Mode:** Agentic Coding
4 | > This file is the persistent memory layer for Claude Code. Read it fully before touching any code.
5 |
6 | ---
7 |
8 | ## 1. Project Overview
9 |
10 | A **Generative BI (GenBI) platform** that enables business users to query enterprise data warehouses using natural language, auto-generates visualizations and narrative insights, and delivers governed, explainable analytics at scale.
11 |
12 | **Core value proposition:**
13 | - Natural language → SQL → chart + narrative (single interaction cycle)
14 | - Semantic layer as the single source of truth for metrics
15 | - Multi-tenant, role-aware data access with full audit trail
16 | - Deployable on-premise or cloud for regulated industries (FSI, AML/KYC contexts)
17 |
18 | **Primary users:** Data analysts, business stakeholders, compliance officers, C-suite
19 | **Persona:** Users who know *what* they want to see but not *how* to query it
20 |
21 | ---
22 |
23 | ## 2. Tech Stack
24 |
25 | ...
26 | Backend: Python 3.12 · FastAPI · Uvicorn / Gunicorn
27 | LLM Layer: Anthropic Claude API (claude-opus-4 for reasoning, claude-haiku-4 for speed)
28 |            LangChain / LangGraph for orchestration and agent loops
29 |            llamaIndex for semantic indexing and RAG
30 | Semantic Layer: dbt (MetricFlow) + Cube.dev (headless BI / metrics API)
31 | Databases: PostgreSQL 16 (primary store, metadata, audit)
32 |            Apache AGE (graph queries for lineage & relationship analysis)
33 |            pgvector (schema embeddings, semantic search)
34 |            Redis (query cache, session state)
35 | Vector Store: pgvector (default) / Weaviate (scale-out option)
36 | Charts: Vega-Lite (declarative) + Plotly.js (interactive frontend)
37 | Frontend: Next.js 15 (App Router) · TypeScript 5.9 · Tailwind CSS v4 · shadcn/ui
38 | Auth/RBAC: FastAPI + JWT + row-level security (PostgreSQL RLS)
39 |            DID/VC-compatible identity hooks (future)
40 | Containerization: Docker + Docker Compose · GitHub Actions CI
41 | Observability: OpenTelemetry · Langfuse (LLM tracing) · Prometheus + Grafana
42 | ...
43 |
44 | **Package managers:** `uv` for Python (NOT pip/poetry), `pnpm` for Node (NOT npm/yarn)
45 | **Python version:** 3.12 – use match/case, walrus operator, typed dicts freely
46 | **NEVER use:** raw `pip install`, `npm install`, `yarn`
47 |
48 | ---
49 |
50 | ## 3. Architecture Layers
51 |
52 | ...
53 |
54 | 

|                                                                                                                               |                |                 |                 |
|-------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|-----------------|
| Layer 1: Interface (Next.js, REST, Slack)                                                                                     |                |                 |                 |
| Layer 2: Orchestration (LangGraph Agents)                                                                                     |                |                 |                 |
| 58   <table border="1"> 59         <tr> <td>NL2SQL Agent</td> <td>ChartGen Agent</td> <td>Narrative Agent</td> </tr> </table> | NL2SQL Agent   | ChartGen Agent  | Narrative Agent |
| NL2SQL Agent                                                                                                                  | ChartGen Agent | Narrative Agent |                 |
| Layer 3: Semantic Layer (dbt + Cube.dev)                                                                                      |                |                 |                 |
| Metrics store · Schema catalog · RLS rules                                                                                    |                |                 |                 |
| Layer 4: Data Retrieval                                                                                                       |                |                 |                 |
| PostgreSQL · Snowflake · Redshift (via SQLAlchemy connectors)                                                                 |                |                 |                 |
| Layer 5: Governance & Audit                                                                                                   |                |                 |                 |
| Prompt logs · Query lineage · Feedback                                                                                        |                |                 |                 |

67 |
68 | ...
69 |
70 | ### Agent Responsibilities
71 |
72 | | Agent | Input | Output | Model |
73 | |---|---|---|---|
74 | | `NL2SQLAgent` | User prompt + schema context | SQL query + explanation | claude-opus-4 |
75 | | `ChartGenAgent` | SQL result set + prompt intent | Vega-Lite spec JSON | claude-haiku-4 |
76 | | `NarrativeAgent` | Data + chart + business context | Insight paragraph | claude-haiku-4 |
77 | | `RouterAgent` | Raw user query | Agent dispatch plan | claude-haiku-4 |
78 | | `ValidationAgent` | Generated SQL | Safety check + dry-run | deterministic |
79 |
80 | ---
81 |

135 |
136 | ```bash
137 | # Backend
138 | cd backend
139 | uv run uvicorn app.main:app --reload --port 8000 # dev server
140 | uv run pytest tests/ -v --tb=short # run tests
141 | uv run alembic upgrade head # apply migrations
142 | uv run alembic revision --autogenerate -m "msg" # new migration
143 | uv run ruff check . && uv run ruff format --check . # lint + format
144 |
145 | # Frontend
146 | cd frontend
147 | pnpm dev # Next.js dev (port 3000)
148 | pnpm build && pnpm start # production build
149 | pnpm lint # ESLint
150 | pnpm typecheck # tsc --noEmit
151 |
152 | # Full stack
153 | docker compose -f infra/docker-compose.dev.yml up -d # start all services
154 | docker compose down -v # tear down (keeps volumes)
155 | docker compose logs -f backend # tail backend logs
156 |
157 | # Semantic layer
158 | cd semantic/dbt
159 | dbt run --select +metrics.* # run dbt models
160 | dbt test # run dbt tests
161 | ```
162 |
163 | ---
164 |
165 | ## 6. Hard Rules – NEVER Violate
166 |
167 | ### Security & Data Safety
168 | - **NEVER generate destructive SQL** (DROP, DELETE, TRUNCATE) – all DB access is READ-ONLY through the query engine. Insert/update only via explicit service methods.
169 | - **NEVER expose raw connection strings or secrets** in responses, logs, or LLM prompts. Use env vars; reference `settings.py` which loads from `.env`
170 | - **NEVER pass user-submitted strings directly into SQL**. Always use SQLAlchemy parameterized queries or the query validator.
171 | - **NEVER bypass `ValidationAgent`** before executing generated SQL in production paths.
172 |
173 | ### LLM & Agent Rules
174 | - **NEVER hardcode model names** in business logic – always reference `settings.LLM_REASONING_MODEL` and `settings.LLM_FAST_MODEL`.
175 | - **NEVER call LLM APIs without timeout + retry logic**. Use the `llm_client.py` wrapper.
176 | - **NEVER store raw user prompts in plaintext DB** without first stripping PII via the sanitizer middleware.
177 | - **Every agent must log**: input tokens, output tokens, latency, model version, and user_id to the `audit_log` table.
178 |
179 | ### Code Conventions
180 | - **NEVER use `print()` for logging** – use `loguru` logger (`from app.core.logging import logger`).
181 | - **NEVER use `Any` type in Pydantic models** – define explicit schemas.
182 | - **NEVER commit `.env` files** – use `.env.example` with placeholder values only.
183 | - **ALL API routes are versioned** under `/api/v1/` – no bare routes.
184 |
185 | ---
186 |
187 | ## 7. Coding Conventions
188 |
189 | ### Python / Backend
190 | - **Async everywhere**: all FastAPI routes and DB calls are `async def`; use `asyncpg` driver
191 | - **Pydantic v2**: use `model_validator`, `field_validator`, `model_config` – not v1 syntax
192 | - **SQLAlchemy 2.0**: use `select()`, `Session.execute()`, mapped classes – NOT legacy Query API
193 | - **Error handling**: raise `HTTPException` with typed detail dicts `{"code": "...", "message": "..."}`
194 | - **Dependency injection**: auth/session/db via FastAPI `Depends()` – never instantiate in route body
195 | - **File naming**: `snake_case` for Python files, `kebab-case` for frontend files
196 |
197 | ### TypeScript / Frontend
198 | - **Server components by default** – add `"use client"` only for interactive components
199 | - **All data fetching via** `src/lib/api-client.ts` – never `fetch()` directly in components
200 | - **Zod schemas** for all API response validation in frontend
201 | - **shadcn/ui components** as base – extend with Tailwind, never override base component internals
202 |

```

```

203 | ### Agent & LLM Patterns
204 | - **Prompt templates are versioned files** in `.claude/prompts/` - never inline long prompts in code
205 | - **Few-shot examples** live in `backend/app/agents/examples/` - load dynamically, not hardcoded
206 | - **Schema context compression**: embed only relevant table/column metadata (top-k by cosine similarity from pgvector) - never send full DB schema to
207 | LLM
208 | - **Chain of thought**: reasoning models (`claude-opus-4`) always use `thinking` blocks for SQL generation; fast models (`claude-haiku-4`) use direct
209 | generation
210 | ---
211 | ## 8. Database Rules
212 |
213 | ```sql
214 | -- Every table MUST have:
215 | id          UUID PRIMARY KEY DEFAULT gen_random_uuid()
216 | created_at  TIMESTAMPTZ NOT NULL DEFAULT NOW()
217 | updated_at  TIMESTAMPTZ NOT NULL DEFAULT NOW()
218 | tenant_id   UUID NOT NULL REFERENCES tenants(id) -- for multi-tenancy
219 |
220 | -- RLS policy must exist for every user-data table
221 | ALTER TABLE <table> ENABLE ROW LEVEL SECURITY;
222 | ```
223 |
224 | - **NEVER drop columns** - mark as `deprecated_at TIMESTAMPTZ` first, remove after 2 sprint cycles
225 | - **Migrations**: Alembic only - no manual `ALTER TABLE` in psql
226 | - **Indexes**: all foreign keys and `tenant_id` columns must be indexed
227 | - **Query timeout**: all analytical queries are capped at 30s via `SET statement_timeout = '30s'`
228 | - **Apache AGE**: graph queries for data lineage use the `genbi_graph` graph - schema in `backend/app/db/graph_schema.py`
229 |
230 | ---
231 |
232 | ## 9. Testing Approach
233 |
234 | ```
235 | Unit tests:      Pure functions, agent logic, prompt builders, validators
236 | Integration tests: API routes with test DB, semantic layer queries
237 | E2E tests:       Full NL → SQL → chart → narrative pipeline (slow, marked @pytest.mark.e2e)
238 | LLM eval tests:  Golden dataset of NL/SQL pairs in tests/evals/nl2sql_golden.json
239 | ```
240 |
241 | - **Always mock LLM calls in unit/integration tests** using `tests/fixtures/llm_mock.py`
242 | - **Golden NL2SQL test suite** must pass before any merge to `main` (20 queries, 90% accuracy threshold)
243 | - **Test DB** is a separate PostgreSQL instance with synthetic data (see `infra/postgres/test_seed.sql`)
244 | - Run: `uv run pytest tests/ -v -m "not e2e"` for fast local feedback
245 |
246 | ---
247 |
248 | ## 10. Semantic Layer Rules
249 |
250 | - **Metrics are defined ONCE in dbt MetricFlow** - `semantic/dbt/models/metrics/`
251 | - **Cube.dev** exposes those metrics via REST + GraphQL API to agents and frontend
252 | - **NEVER re-implement metric logic** in agent prompts or service code - always query via Cube API
253 | - **Schema catalog** is synchronized to pgvector embeddings nightly via `scripts/embed_schema.py`
254 | - **Column descriptions** are mandatory for all semantic model fields - they are injected into LLM context
255 |
256 | ---
257 |
258 | ## 11. Multi-Tenancy & Access Control
259 |
260 | - All queries are scoped by `tenant_id` injected from JWT claims
261 | - Row-level security (PostgreSQL RLS) enforces data isolation at DB level
262 | - Column-level masking for PII fields (defined in `backend/app/core/masking.py`)
263 | - Agent prompts include: "You are operating for tenant {tenant_id} with role {user_role}. Only access data within your authorized scope."
264 | - Audit log records: `user_id`, `tenant_id`, `query_text`, `generated_sql`, `model_version`, `latency_ms`, `token_count`
265 |
266 | ---
267 |
268 | ## 12. Observability & Governance
269 |
270 | ```python
271 | # Every LLM call must produce an AuditEntry
272 | AuditEntry(
273 |     session_id=...,
274 |     user_id=...,
275 |     tenant_id=...,
276 |     input_prompt_hash=..., # SHA-256, not raw text
277 |     generated_sql=...,
278 |     model_name=...,
279 |     model_version=...,
280 |     input_tokens=...,
281 |     output_tokens=...,
282 |     latency_ms=...,
283 |     feedback_score=None, # filled post-hoc
284 |     hallucination_flag=False
285 | )
286 | ```
287 |
288 | - **Langfuse** is the LLM tracing backend - all traces tagged with `project=genbi`, `env=prod|dev`
289 | - **OpenTelemetry** spans wrap every agent call and DB query
290 | - **Hallucination detection**: if SQL result row count is 0 or diverges >50% from prior similar queries, flag for human review
291 |
292 | ---
293 |
294 | ## 13. DO NOT MODIFY (Stable / Protected)
295 |
296 | | Path | Reason |
297 | |---|---|
298 | | `backend/app/core/auth.py` | JWT + RBAC logic - changes need security review |
299 | | `backend/app/db/migrations/` | Alembic history - never edit existing migration files |
300 | | `backend/app/agents/validation/validation_agent.py` | SQL safety gate - any relaxation needs explicit approval |
301 | | `semantic/cube/schema/` | Metric definitions - changes affect downstream Cube API |
302 | | `infra/postgres/init.sql` | DB initialization - destructive if changed incorrectly |
303 |
304 | ---
305 |

```

```

306 ## 14. Deployment
307
308 ...
309 Dev:      docker compose -f infra/docker-compose.dev.yml up
310 Staging:  GitHub Actions → build Docker images → push to registry → deploy to K8s (staging NS)
311 Prod:     Manual approval gate in GitHub Actions → K8s (prod NS) rolling update
312
313 Required env vars (set in CI secrets / K8s secrets):
314 ANTHROPIC_API_KEY
315 DATABASE_URL      # asyncpg format: postgresql+asyncpg://...
316 REDIS_URL
317 CUBE_API_URL
318 CUBE_API_SECRET
319 LANGFUSE_SECRET_KEY
320 LANGFUSE_PUBLIC_KEY
321 JWT_SECRET_KEY
322 TENANT_ENCRYPTION_KEY
323
324 Frontend build: `pnpm build` — outputs to .next/
325 Backend build: Docker image from backend/Dockerfile
326 ...
327
328 ---
329
330 ## 15. Context Pointers
331
332 - `@docs/adr/001-semantic-layer-choice.md` — why dbt + Cube over standalone solutions
333 - `@docs/adr/002-agent-architecture.md` — LangGraph multi-agent topology decision
334 - `@docs/adr/003-nl2sql-approach.md` — schema embedding strategy and prompt design
335 - `@backend/app/agents/README.md` — agent registry and inter-agent messaging protocol
336 - `@semantic/dbt/README.md` — metric taxonomy and naming conventions
337
338 ---
339
340 ## 16. Common Tasks
341
342 **Add a new data source connector:**
343 1. Create `backend/app/connectors/{name}_connector.py` implementing `BaseConnector`
344 2. Register in `backend/app/connectors/registry.py`
345 3. Add schema embedding job in `scripts/embed_schema.py`
346 4. Add connector integration test in `tests/connectors/`
347 5. Update `.env.example` with new connection string variable
348
349 **Add a new metric:**
350 1. Define in `semantic/dbt/models/metrics/{domain}.yml` using MetricFlow syntax
351 2. Run `dbt run --select +metrics.{domain}` + `dbt test`
352 3. Cube.dev picks up on next sync (or `cd semantic/cube && cube build`)
353 4. Embed updated schema: `uv run python scripts/embed_schema.py --domain {domain}`
354
355 **Add a new agent:**
356 1. Create `backend/app/agents/{name}_agent.py` extending `BaseAgent`
357 2. Register in `backend/app/agents/registry.py` with trigger conditions
358 3. Add unit tests in `tests/agents/test_{name}_agent.py` with mocked LLM
359 4. Add golden eval cases to `tests/evals/` if the agent generates SQL or charts
360 5. Update `RouterAgent` dispatch table in `backend/app/agents/router_agent.py`
361
362 **Debug a hallucinated SQL query:**
363 1. Pull audit log: `SELECT * FROM audit_log WHERE session_id = '...'`
364 2. Check Langfuse trace for the session — inspect retrieved schema context
365 3. Check pgvector similarity scores in `schema_embeddings` table
366 4. If schema context was wrong, re-run `scripts/embed_schema.py` for affected tables
367 5. Add the failing NL query to `tests/evals/nl2sql_golden.json` as a regression case
368
369 ---
370
371 ## 17. Session Notes
372
373 When compacting, always preserve:
374 - The current migration state (last applied Alembic revision)
375 - Any failing golden eval queries and their root cause analysis
376 - Active agent architecture decisions in progress
377 - Any LLM prompt changes and their eval impact
378
379 ...

```

1 | # ADR 001: Dual Chart Stack – Flint MCP + AntV G2
2 |
3 | **Status:** Accepted
4 | **Date:** 2026-07-04
5 | **Author:** Iven Kwan
6 |
7 | ## Context
8 |
9 | GenBI needs to render charts from natural language queries. We evaluated two approaches:
10 |
11 | 1. **AntV G2 only** (DB-GPT's default): Interactive, web-native charts using G2's Grammar of Graphics. Used by DB-GPT's GPT-Vis protocol.
12 | 2. **Flint MCP only** (Microsoft's new chart framework): Unified `ChartAssemblyInput` spec compiled to Vega-Lite/ECharts/Chart.js. MCP-native, local rendering, PNG+SVG output.
13 |
14 | ## Decision
15 |
16 | **We will use a dual-stack approach:**
17 |
18 | - **Flint MCP** for static, export-quality charts (PNG/SVG for reports, emails, documents, dashboards)
19 | - **AntV G2** (via GPT-Vis protocol) for interactive dashboard widgets (hover, zoom, brush, drill-down)
20 |
21 | These are complementary, not competing. The agent pipeline selects the appropriate renderer based on context:
22 |
23 | | Scenario | Renderer |
24 | |---|---|
25 | | Chat response with chart | Flint (SVG embedded inline) |
26 | | Report generation | Flint (PNG at 2x scale) |
27 | | Interactive dashboard tile | G2 (interactive canvas) |
28 | | Email attachment | Flint (PNG) |
29 | | Data exploration with brushing | G2 (interactive) |
30 |
31 | ## Rationale
32 |
33 | **Why not Flint-only:** Flint is v0.1.0, stdio-only transport, no interactive features. It can't handle live dashboard widgets with hover/zoom/brush. Maturity risk for critical-path production use.
34 |
35 | **Why not G2-only:** G2 produces only canvas/web output – no clean PNG/SVG export for documents and emails. The LLM has to navigate G2's complex configuration directly. Flint's unified schema is simpler for AI agents to author.
36 |
37 | **Why both:** Each solves the other's weakness. Flint's unified schema is the AI-friendly authoring format. G2 is the interactive rendering engine. The `vis-flint` protocol extension routes static charts to Flint and interactive ones to G2.
38 |
39 | ## Consequences
40 |
41 | - **Positive:** Best-in-class output for each use case. AI agent gets simple schema (Flint), users get interactive exploration (G2).
42 | - **Negative:** Two chart stacks to maintain, deploy, and debug. Vendor risk on Flint (Microsoft, v0.1.0). Need `flint-chart-mcp` Node.js dependency alongside Python backend.
43 | - **Mitigation:** FlintChartBridge has a Vega-Lite/Altair fallback path that doesn't require Flint MCP at all – the system runs without Flint if needed. Flint can be added later when it stabilizes.

```

docs/adr/002-agent-architecture.md

44 lines · 1.9 KB

```

1 | # ADR 002: Multi-Agent Architecture with LangGraph
2 |
3 | **Status:** Accepted
4 | **Date:** 2026-07-04
5 | **Author:** Iven Kwan
6 |
7 | ## Context
8 |
9 | The GenBI pipeline (NL → SQL → Chart → Narrative) can be implemented as a single monolithic LLM call or as a chain of specialized agents. We need to d
9 | ecide the agent topology.
10 |
11 | ## Decision
12 |
13 | **Multi-agent pipeline orchestrated by LangGraph, inspired by DB-GPT's AWEL patterns.**
14 |
15 | ```
16 | User Query
17 |   → RouterAgent (intent classification)
18 |   → NL2SQLAgent (SQL generation with schema context)
19 |     → ValidationAgent (SQL safety check + dry-run EXPLAIN)
20 |       → Query Executor (read-only execution via SQLAlchemy)
21 |         → ChartGenAgent (Flint ChartAssemblyInput spec + render)
22 |           → NarrativeAgent (insight paragraph)
23 | ```
24 |
25 | Each agent is a LangGraph node with a typed interface (`BaseAgent` → `AgentResult`). The `RouterAgent` classifies intent and selects which pipeline to
25 | run – not all queries need all agents.
26 |
27 | ## Rationale
28 |
29 | **Why multi-agent over monolithic:**
30 | - Specialized prompts produce better results (SQL agent focuses on SQL, chart agent on visual encoding, etc.)
31 | - Each agent can use a different model (Opus-4 for SQL reasoning, Haiku-4 for chart specs)
32 | - Independent testing and evaluation (golden NL2SQL test suite independent from chart quality)
33 | - Audit trail at agent granularity (which agent hallucinated?)
34 |
35 | **Why LangGraph over raw LangChain chains:**
36 | - Conditional routing (skip chart if no data, add validation only for SQL paths)
37 | - Checkpointing for multi-turn conversations
38 | - Streaming per-agent progress to the frontend
39 |
40 | ## Consequences
41 |
42 | - **Positive:** Modular, testable, observable. Model selection per agent. Independent iteration.
43 | - **Negative:** More LLM calls per query (cost and latency). State management between agents. Need shared audit/observability layer.
44 | - **Mitigation:** RouterAgent skips unnecessary agents. Fast model (Haiku-4) for non-SQL agents. Shared `AuditLog` model across all agents.

```

docs/adr/003-vis-flint-protocol.md

43 lines · 1.8 KB

```

1 | # ADR 003: vis-flint Protocol Extension
2 |
3 | **Status:** Accepted
4 | **Date:** 2026-07-04
5 | **Author:** Iven Kwan
6 |
7 | ## Context
8 |
9 | DB-GPT's GPT-Vis protocol uses markdown code blocks (``vis-dashboard, ``vis_chart) to embed chart specifications in LLM responses. The frontend pars
9 | es these blocks and renders AntV G2 charts. We need to extend this protocol for Flint Chart rendering.
10 |
11 | ## Decision
12 |
13 | **Add a new `vis-flint` code block type that routes to Flint MCP for rendering.**
14 |
15 | Extend the GPT-Vis protocol:
16 | - ``vis-dashboard` → AntV G2 (existing, for interactive multi-chart dashboards)
17 | - ``vis_chart` → AntV G2 (existing, for single interactive charts)
18 | - ``vis-flint` → Flint MCP (new, for static PNG/SVG charts)
19 |
20 | The vis-flint block contains a raw `ChartAssemblyInput` JSON spec:
21 |
22 | ````
23 | ``vis-flint
24 | {
25 |   "chartType": "Bar Chart",
26 |   "encodings": {"x": {"field": "region"}, "y": {"field": "revenue"}},
27 |   "data": {"values": [...]}
28 | }
29 | ````
30 |
31 |
32 | ## Rationale
33 |
34 | - **Backward compatible:** Existing vis-dashboard and vis_chart blocks continue to work with G2
35 | - **Self-documenting:** The block type signals which renderer to use – no heuristic detection needed
36 | - **AI-friendly:** The LLM emits the same `ChartAssemblyInput` schema it learned from Flint's agent skill
37 | - **Frontend dispatch:** The markdown parser routes by block type – adding a new renderer is a registry entry
38 |
39 | ## Consequences
40 |
41 | - **Positive:** Clean separation of static (Flint) and interactive (G2) chart paths. The LLM chooses the right format by emitting the right code block
41 | .
42 | - **Negative:** Two rendering paths in the chat pipeline. Frontend needs to handle both SVG (Flint) and canvas (G2) embeds.
43 | - **Implementation:** Backend `vis_flint_protocol.py` module parses vis-flint blocks, renders via FlintChartBridge, and replaces blocks with inline SV
43 | G or base64 PNG.

```

docs/adr/004-flint-bridge-fallback.md

39 lines · 1.9 KB

```

1 | # ADR 004: FlintChartBridge with Vega-Lite Fallback
2 |
3 | **Status:** Accepted
4 | **Date:** 2026-07-04
5 | **Author:** Iven Kwan
6 |
7 | ## Context
8 |
9 | Flint Chart (`flint-chart-mcp`) is v0.1.0 – very early stage, stdio-only transport, no HTTP/SSE, and subject to breaking changes. We need a chart rendering strategy that works today but can upgrade to Flint MCP when it stabilizes.
10 |
11 | ## Decision
12 |
13 | **Implement a `FlintChartBridge` with a Vega-Lite/Altair fallback path.**
14 |
15 | The bridge's architecture:
16 |
17 | ```
18 | FlintChartBridge
19 |   | Primary path: Flint MCP (via npx flint-chart-mcp stdio)
20 |   |   ↓ compiles ChartAssemblyInput → Vega-Lite/ECharts/Chart.js → PNG/SVG
21 |   |
22 |   | Fallback path: Altair (Python Vega-Lite wrapper)
23 |   |   ↓ translates ChartAssemblyInput → Altair chart → SVG → PNG (via resvg)
24 |   |
25 |   ```
26 |
27 | The bridge auto-detects Flint availability and falls back silently. The `ChartAssemblyInput` schema is the unified API regardless of which path is active – callers never know whether Flint or Altair rendered the chart.
28 |
29 | ## Rationale
30 |
31 | - **Ship without Flint dependency:** The system works with just Altair installed. Flint is a future upgrade.
32 | - **Same schema, same output:** Both paths accept `ChartAssemblyInput` and produce PNG/SVG. Callers are unchanged.
33 | - **Graceful degradation:** If Flint MCP isn't available (CI, dev machines without Node, production without npm), Altair handles everything.
34 | - **Migration path:** When Flint reaches v1.0 with SSE transport, we flip the primary path and keep Altair as the fallback.
35 |
36 | ## Consequences
37 |
38 | - **Positive:** Zero-risk Flint adoption. System runs today. Upgradable tomorrow.
39 | - **Negative:** Altair has fewer chart types than Flint's full catalog. The fallback covers ~15 types vs. Flint's ~40. ECharts chart types (Sankey, radar, treemap) are Flint-only.
40 | - **Mitigation:** The bridge returns warnings when a chart type falls outside Altair's supported set. The LLM is prompted to prefer types in the interactive section.

```

docs/adr/005-age-and-pgvector-image.md

68 lines · 3.1 KB

```

1 | # ADR 005: PostgreSQL image with both pgvector and Apache AGE
2 |
3 | - **Status:** Accepted
4 | - **Date:** 2026-08-05
5 | - **Supersedes:** the implicit decision in the initial commit to use
6 |   `pgvector/pgvector:pg16` while running `CREATE EXTENSION age` in `init.sql`.
7 |
8 | ## Context
9 |
10 | The platform relies on two PostgreSQL extensions simultaneously:
11 |
12 | - **pgvector** – stores schema/example embeddings for NL2SQL semantic search
13 |   (`schema_embeddings.embedding VECTOR(1536)`, `agent_examples.embedding`).
14 | - **Apache AGE** – property graph for data lineage and downstream-impact
15 |   analysis (`backend/app/db/graph_schema.py`, graph `genbi_graph`).
16 |
17 | The initial `docker-compose.yml` used `pgvector/pgvector:pg16`, which bundles
18 | pgvector only. As a result `init.sql:11` (`CREATE EXTENSION age;`) and
19 | `LOAD 'age';` failed on first container boot, the lineage graph could never be
20 | created, and `init_age_graph()` crashed any code path that touched lineage.
21 |
22 | ## Decision
23 |
24 | Build a custom Postgres image that layers Apache AGE onto the pgvector
25 | image, rather than choosing one extension's stock image over the other.
26 |
27 | `infra/postgres/Dockerfile`:
28 |
29 | ```dockerfile
30 | FROM pgvector/pgvector:pg16
31 | RUN apk add --no-cache --virtual .age-build build-base clang llvm-dev git coreutils \
32 |   && git clone --depth 1 --branch PG16 https://github.com/apache/age /age-src \
33 |   && cd /age-src && make PG_CONFIG=/usr/local/bin/pg_config install \
34 |   && cd / && rm -rf /age-src && apk del .age-build
35 | ```
36 |
37 | Both `infra/docker-compose.dev.yml` and `infra/docker-compose.yml` now
38 | `build: .postgres` with image tag `genbi/postgres-pgvector-age:pg16`.
39 |
40 | ### Defense-in-depth: AGE is optional at boot
41 |
42 | `init.sql` guards the extension so a missing AGE degrades gracefully instead of
43 | crashing DB init – controlled by `GENBI_ENABLE_AGE` (default `true`). This
44 | keeps dev fast (AGE build is the slowest image layer) and lets a contributor
45 | without AGE still bring up the rest of the stack.
46 |
47 | ## Alternatives considered
48 |
49 | 1. apache/age:PG16 + build pgvector into it – symmetric to the chosen
50 |   approach, but AGE's upstream image is less frequently maintained and the
51 |   pgvector build path is less battle-tested. Rejected.
52 | 2. Drop AGE, use recursive CTEs for lineage – would lose the property-graph
53 |   query model (multi-hop impact analysis) that the graph layer is built around.
54 |   Rejected; lineage is a documented capability.
55 | 3. Run AGE in a separate Postgres instance – doubles operational surface
56 |   (two DBs, two backup strategies, cross-DB joins impossible). Rejected.
57 |
58 | ## Consequences
59 |
60 | - Build time: the first `docker compose build` compiles AGE from source
61 |   (~2-3 min). Cached thereafter.
62 | - Maintenance: the AGE git branch (`PG16`) must track AGE releases; bumping
63 |   Postgres major versions requires rebuilding AGE against the new headers.
64 | - Roles: `init.sql` grants `ag_catalog` usage to `PUBLIC` (dev convenience).
65 |   Production should restrict this to a dedicated `age_admin` role.
66 | - Verification: `infra/postgres/Dockerfile` ends with a
67 |   `RUN test -f $(pg_config --pkglibdir)/age.so` so a broken AGE release fails
68 |   the image build, not a runtime boot.

```

1 | # ADR 006: Enforced tenant isolation via dedicated database roles
2 |
3 | - **Status:** Accepted (2026-08-15)
4 | - **Context:** Phase 8b – Multi-tenant RLS enforcement
5 | - **Related:** `infra/postgres/init.sql`, Alembic revisions `0002_app_roles` and
6 |   `0003_analytics`, `backend/app/db/session.py`, `docs/data-layer.md`
7 |
8 | ## Context
9 |
10 | Since Phase 6 the schema has had `ENABLE`/`FORCE ROW LEVEL SECURITY` plus a
11 | `tenant_isolation` policy on every tenant-scoped table, keyed on the
12 | `app.current_tenant_id` session GUC that `PostgreSQLConnector` sets per
13 | transaction. The fine print: **RLS never constrains superusers**, and the
14 | backend connected as `POSTGRES_USER` (`genbi`) – a superuser in the official
15 | Postgres image. Tenant isolation was configured but never enforced; any code
16 | path (or SQL injection) that skipped the GUC would read cross-tenant data.
17 |
18 | A second gap: the 10 analytics tables that chat queries actually read
19 | (`sales`, `orders`, ...) were not RLS-enrolled at all – only the 5 metadata
20 | tables were – so the connector's GUC had no effect on query results.
21 |
22 | The login path added in Phase 8a complicated the fix: login must find a user
23 | by email *across* tenants (to support per-tenant credentials and
24 | disambiguation), which a per-tenant RLS policy forbids by design.
25 |
26 | ## Decision
27 |
28 | 1. **Two dedicated non-superuser LOGIN roles** (Alembic `0002`, mirrored in
29 |   `init.sql` for fresh volumes; fixed dev passwords, rotate in production):
30 |   - `genbi_app` – the runtime role for the ORM engine and the query
31 |     connector (`DATABASE_URL`). No superuser, no `BYPASSRLS`, no `CREATE`;
32 |     granted exactly the DML it needs on the tenant tables and `SELECT` on
33 |     analytics tables. Every RLS policy applies to it.
34 |   - `genbi_auth` – the login endpoint's role (`DATABASE_URL_AUTH`, derived
35 |     from `DATABASE_URL` when unset). `SELECT` on `users` only, plus a
36 |     permissive RLS policy scoped `TO genbi_auth`
37 |     (`users_login_lookup ... USING (true)`) – the single, auditable
38 |     carve-out that a credential lookup requires. It can read nothing else
39 |     and write nothing.
40 | 2. **Analytics tables join the RLS regime** (Alembic `0003`): the 10 seed
41 |   tables (renamed `users` → `web_users` to stop shadowing the app-login
42 |   table) get the same FORCE RLS + `tenant_isolation` policy. The connector
43 |   already set the GUC, so chat queries keep working – but a missing GUC now
44 |   yields zero rows instead of cross-tenant data.
45 | 3. **Owner credentials are exiled to `DATABASE_URL_SYNC`**, used only by
46 |   Alembic and admin scripts (`scripts/db_admin.py`). Those scripts connect
47 |   as the owner *and* set the tenant GUC, because FORCE RLS binds the owner
48 |   too.
49 | 4. **Enforcement is tested, not assumed**: `tests/api/test_tenant_isolation.py`
50 |   connects with the real roles and asserts cross-tenant invisibility,
51 |   forged-tenant INSERT rejection, no-GUC blindness, and the genbi_auth
52 |   carve-out's exact boundaries. `scripts/verify.sh` checks the same in the
53 |   running stack.
54 |
55 | ## Consequences
56 |
57 | - A compromised or buggy backend can no longer read another tenant's rows by
58 |   forgetting the GUC; it can only see rows the policy allows.
59 | - `genbi_auth` remains a cross-tenant read oracle on `users` by necessity
60 |   (login); the endpoint returns indistinguishable 401s and is the natural
61 |   place for future rate limiting.
62 | - Writing to any tenant table through the ORM now requires setting the GUC
63 |   on the session (no ORM writers exist yet; the isolation tests and
64 |   `db_admin.set_tenant_guc` are the pattern to copy).
65 | - Alembic stays on `DATABASE_URL_SYNC`; migrations that create roles or
66 |   policies must keep running as the owner.
67 | - AGE lineage code (`graph_schema.py`) remains dead code with
68 |   f-string-interpolated Cypher; parameterizing it is a tracked follow-up
69 |   before it can be wired to the runtime role.

```

docs/adr/007-cube-native-semantic-layer.md

70 lines · 3.6 KB

```

1 | # ADR 007: Cube-native semantic layer (dropping the dbt tier)
2 |
3 | - **Status:** Accepted (2026-08-15)
4 | - **Context:** Phase 9 – Real metric catalog
5 | - **Supersedes:** the dbt MetricFlow design described in earlier revisions of
6 |   `docs/semantic-layer.md` and `semantic/README.md`
7 | - **Related:** ADR 006 (enforced RLS), `semantic/cube/model/`,
8 |   `backend/app/semantic/cube_client.py`
9 |
10 | ## Context
11 |
12 | The original design was a three-tier pipeline: dbt MetricFlow YAML → dbt
13 | manifest → Cube (via `semantic_layer_sync`) → `CubeClient` → agents. Phase 9
14 | planning found every link of that pipeline non-functional:
15 |
16 | 1. **dbt was never installed** – no dependency in `pyproject.toml`/`uv.lock`,
17 |   no Dockerfile entry, no CI job, no `profiles.yml`; `dbt parse/run` could
18 |   not execute anywhere.
19 | 2. **The bridge was fictional** – `semantic_layer_sync` in `cube.js` is a
20 |   Cube Cloud feature, not Cube Core; the manifest it pointed at could never
21 |   be generated.
22 | 3. **The toy metric YAML was invalid** – `revenue.yml` referenced measures
23 |   (`user_id`, `conversions`, `total_users`) that no semantic model defined.
24 | 4. **The Cube container was unwired** – no volume mounts at all: it could not
25 |   read `cube.js`, any schema, or any manifest.
26 |
27 | Meanwhile the consumer side was real and tested: `CubeClient` (719 lines,
28 | 393 test lines locking the `/meta` and `/load` contracts), the ChatService →
29 | NL2SQL metric-context injection, and the per-tenant metric cache.
30 |
31 | A second constraint: Phase 8b enforced RLS on all analytics tables.
32 | Cube's `cube_reader` role sees **zero rows** without a per-tenant
33 | `app.current_tenant_id` GUC – so Cube `data` queries need driver-level
34 | tenant work regardless of where metric definitions live.
35 |
36 | ## Decision
37 |
38 | 1. **Cube-native data models are the single source of truth.** Ten cubes in
39 |   `semantic/cube/model/` over the seeded analytics tables (23 measures:
40 |   revenue, orders, customers, transactions, web users, activity, deals,
41 |   reps, products, regions). Joins only where seed foreign keys are real.
42 |   Every cube carries a hidden `tenant_id` dimension as the Phase-10 hook.
43 | 2. **Delete the dbt scaffold** (`semantic/dbt/`) rather than maintain a
44 |   second, unrunnable definition format.
45 | 3. **Wire the Cube runtime properly:** standard `CUBEJS_DB_*` env (read-only
46 |   `cube_reader` role), project mounted at `/cube/conf`, `node`-based
47 |   healthcheck.
48 | 4. **Scope data queries out:** `/metrics/list` (metadata) ships now;
49 |   `/metrics/query` waits for per-tenant GUC driver work
50 |   (`contextToOrchestratorId` + connection-init SQL) in Phase 10, together
51 |   with the Explore UI.
52 | 5. **Harden the client while here:** real JWT auth (was raw secret –
53 |   dev-mode only), cache the raw `/meta` payload and re-parse on hit (the
54 |   old serialization silently dropped parsed metrics), and rank metrics
55 |   against the user query when the catalog exceeds 20 entries.
56 |
57 | ## Consequences
58 |
59 | - One definition format, one runtime, one test surface; the catalog is
60 |   validated by structural tests in CI without Cube or a database.
61 | - "dbt as source of truth" is gone – accepted because nothing consumed dbt
62 |   artifacts and the repo runs no dbt pipeline. If dbt arrives later (tests,
63 |   freshness checks, staging models), Cube can import from it as an addition,
64 |   not a replacement.
65 | - Metric metadata and metric data have different availability: /meta works
66 |   whenever Cube is up; /load additionally requires the Phase-10 tenant
67 |   driver. `CubeClient.query()` callers must not assume tenant-correct
68 |   results until then.
69 | - The NL2SQL agent now receives a real catalog via the same fail-open path –
70 |   Cube being down degrades prompt quality, never availability.

```

docs/adr/008-per-tenant-cube-data-path.md

63 lines · 3.1 KB

```

1 | # ADR 008: Per-tenant Cube data queries via JWT claims and driver GUC
2 |
3 | - **Status:** Accepted (2026-08-15)
4 | - **Context:** Phase 10 – Metrics + Explore
5 | - **Related:** ADR 006 (enforced RLS), ADR 007 (Cube-native semantic layer),
6 |   `semantic/cube/cube.js`, `backend/app/semantic/cube_client.py`
7 |
8 | ## Context
9 |
10 | ADR 007 shipped the metric catalog but deliberately scoped out data
11 | queries: the analytics tables are FORCE-RLS tenant-scoped (ADR 006), and
12 | Cube's `cube_reader` role sets no `app.current_tenant_id` GUC – so `/load`
13 | returned **zero rows** for every tenant. Metadata (`/meta`) was unaffected.
14 | Phase 10 had to make `/api/v1/metrics/query` tenant-correct without
15 | weakening the RLS guarantees.
16 |
17 | ## Decision
18 |
19 | Four links in a chain, each simple:
20 |
21 | 1. **Backend mints tenant-scoped JWTs.** `CubeClient._auth_token(tenant_id)`
22 |   adds a `tenantId` claim to the standard HS256 token (cached per tenant).
23 |   Cube surfaces JWT claims as `securityContext`. Metadata requests still
24 |   send the anonymous token.
25 | 2. **Cube isolates orchestrators by tenant.** `contextToOrchestratorId`
26 |   keys on `securityContext.tenantId`, so each tenant gets its own driver
27 |   pool – connections are never shared across tenants.
28 | 3. **The driver sets the RLS GUC.** `driverFactory` builds
29 |   `@cubejs-backend/postgres-driver` (bundled in the cubejs/cube image) from
30 |   `CUBEJS_DB_*` env plus the pg `options` connection parameter:
31 |   `-c app.current_tenant_id=<uuid>` – applied on every pooled connection.
32 |   This is the exact GUC the `tenant_isolation` policies consume.
33 | 4. **Postgres RLS remains the enforcement layer.** No tenant filter is
34 |   injected into queries (`queryRewrite` unused): hidden dimensions can't be
35 |   filtered externally, and – decisively – the database, not the query
36 |   builder, decides visibility.
37 |
38 | Query results are cached per tenant (`genbi:{tenant}:cube_query:{hash}`,
39 | TTL 300s) in the existing two-tier cache; the cache key covers every
40 | result-affecting parameter.
41 |
42 | ### Why this is safe to ship without a live Cube to test against
43 |
44 | **The failure mode is closed.** If any link in the chain is misconfigured –
45 | claim missing, orchestrator shared, GUC not applied – Postgres RLS returns
46 | zero rows for the query. It can never return another tenant's data, because
47 | the GUC (or its absence) is the only thing that opens the policy, and a
48 | wrong GUC opens nothing. A misconfiguration is *visible* (empty results,
49 | caught by `make verify`'s tenant-scoped query check) rather than *silent*.
50 |
51 | ## Consequences
52 |
53 | - `/api/v1/metrics/query` and the Explore page deliver tenant-correct data
54 |   with isolation enforced at the same layer as every other query path.
55 | - The backend never trusts Cube for authorization – only Postgres.
56 | - Token handling grows a per-tenant cache (bounded: one token per active
57 |   tenant, 1h expiry, refreshed 5 min early).
58 | - `CubeClient.query()` now requires `tenant_id` for meaningful results under
59 |   RLS; the parameter is optional only so metadata-only environments keep
60 |   working.
61 | - The pg `options` mechanism is standard libpq behavior (session GUCs at
62 |   connect), not a Cube-specific extension – if Cube's driver ever changes
63 |   config pass-through, the failure is the closed one above.

```

docs/agent-system.md

289 lines · 12.6 KB

```

1 | # Agent System
2 |
3 | > See also: [ADR 002: Multi-Agent Architecture](adr/002-agent-architecture.md) | [Architecture Overview](architecture-overview.md)
4 |
5 | ## Overview
6 |
7 | The GenBI agent system is a six-agent pipeline orchestrated by LangGraph, inspired by DB-GPT's AWEL (Agentic Workflow Expression Language) patterns. Each agent is a LangGraph node with a typed interface (BaseAgent → AgentResult). The RouterAgent classifies intent and selects which pipeline to run – not all queries need all agents.
8 |
9 | Two-tier LLM usage:
10 | - Reasoning tasks (NL2SQL) → claude-opus-4 with extended thinking
11 | - Fast tasks (classification, chart spec, narrative) → claude-haiku-4
12 | - Safety tasks (SQL validation, chart validation) → deterministic, zero LLM calls
13 |
14 | ---
15 |
16 | ## Base Framework
17 |
18 | ### AgentConfig
19 |
20 | ```python
21 | @dataclass
22 | class AgentConfig:
23 |     model_name: str
24 |     temperature: float = 0.0
25 |     max_tokens: int = 4096
26 |     thinking: bool = False # Enables Claude extended thinking
27 | ```
28 |
29 | ### AgentResult
30 |
31 | Every agent returns this envelope. The success flag is the primary pass/fail indicator.
32 |
33 | ```python
34 | @dataclass
35 | class AgentResult:
36 |     agent_name: str
37 |     success: bool
38 |     output: dict
39 |     input_tokens: int = 0
40 |     output_tokens: int = 0
41 |     latency_ms: float = 0
42 |     model_version: str = ""
43 |     warnings: list[str] = field(default_factory=list)
44 |     errors: list[str] = field(default_factory=list)
45 |
46 |     @property
47 |     def total_tokens(self) -> int:
48 |         return self.input_tokens + self.output_tokens
49 | ```
50 |
51 | ### BaseAgent (Abstract Class)
52 |
53 | ```python
54 | class BaseAgent(ABC):
55 |     name: str = "base_agent"
56 |     description: str = "Base agent class"
57 |
58 |     def __init__(self, config: AgentConfig):
59 |         self.config = config
60 |         self._run_id = str(uuid4())
61 |
62 |     @abstractmethod
63 |     async def execute(self, **kwargs) -> AgentResult:
64 |         """Execute the agent's core logic. Must be overridden by subclasses."""
65 |
66 |     def _timed_result(self, result: AgentResult, start_time: float) -> AgentResult:
67 |         result.latency_ms = (datetime.now(timezone.utc).timestamp() - start_time) * 1000
68 |         return result
69 | ```
70 |
71 | Contract: All agents accept typed **kwargs in execute(), return AgentResult (never raw exceptions), and call _timed_result() to attach latency.
72 |
73 | ### Registry
74 |
75 | ```python
76 | _registry: dict[str, type[BaseAgent]] = {}
77 |
78 | def register_agent(name: str):
79 |     """Decorator to register an agent class in the global registry."""
80 |     def decorator(cls: type[BaseAgent]) -> type[BaseAgent]:
81 |         cls.name = name
82 |         _registry[name] = cls
83 |         return cls
84 |     return decorator
85 |
86 | def get_agent(name: str) -> type[BaseAgent] | None: ...
87 | def list_agents() -> list[str]: ...
88 | ```
89 |
90 | Agents self-register via the @register_agent("name") decorator on their class. Import triggers registration – no central file needed.
91 |
92 | ---
93 |
94 | ## Agent Roster
95 |
96 | ### 1. RouterAgent
97 |

```

```

98 | Attribute | Value |
99 | ---|---|
100 | **Registered as** | `"router"` |
101 | **Purpose** | Classify user query intent and return a dispatch plan |
102 | **LLM** | `settings.LLM_FAST_MODEL` (Haiku-4), temp=0, max_tokens=256 |
103 | **Key method** | `async def execute(self, query: str, conversation_history: list[dict] | None = None, **kwargs) -> AgentResult` |
104
105 **Intent classification:**
106 | Intent | Pipeline |
107 | ---|---|
108 | `chat_data` | n12sql -> validation -> chart_gen -> narrative |
109 | `chat_visualize` | chart_gen |
110 | `chat_report` | n12sql -> validation -> chart_gen -> narrative |
111 | `chat_knowledge` | narrative (mode: rag) |
112 | `chat_explore` | n12sql (mode: explore) |
113 | *fallback* | n12sql |
114
115 The router returns the plan as output – it does NOT invoke downstream agents. The orchestrator (`ChatService`) reads `output["dispatch_plan"]` and executes steps sequentially.
116
117 ---
118
119 ### 2. NL2SQLAgent
120
121 | Attribute | Value |
122 | ---|---|
123 | **Registered as** | `"n12sql"` |
124 | **Purpose** | Generate read-only SQL from natural language |
125 | **LLM** | `settings.LLM_REASONING_MODEL` (Opus-4), thinking=True, temp=0, max_tokens=4096 |
126 | **Prompt** | `.claude/prompts/n12sql-system.md` (loaded via `load_prompt`) |
127 | **Output format** | JSON (structured output extraction) |
128
129 **Input kwargs:**
130 | Parameter | Type | Required | Description |
131 | ---|---|---|---|
132 | `query` | `str` | Yes | User's natural language question |
133 | `schema_context` | `list[dict]` | No | Top-k relevant tables from pgvector |
134 | `few_shot_examples` | `list[dict]` | No | Similar validated NL/SQL pairs |
135 | `metric_definitions` | `list[dict]` | No | Business metrics from Cube.dev |
136 | `tenant_id` | `str` | No | Default "default" |
137 | `user_id` | `str` | No | For audit |
138 | `session_id` | `str` | No | For audit |
139
140 **Output:** `AgentResult.output` contains `{"sql": "...", "explanation": "...", "tables_used": [...], "assumptions": [...], "run_id": "...}"`
141
142 **Safety:** Runs `_check_destructive_patterns(sql)` – regex-based detection of 11 destructive SQL patterns (DROP, DELETE, TRUNCATE, ALTER, UPDATE, INSERT, CREATE USER, GRANT, REVOKE, COPY FROM). This is defense-in-depth; `ValidationAgent` runs a more comprehensive check downstream.
143
144 ---
145
146 ### 3. ValidationAgent
147
148 | Attribute | Value |
149 | ---|---|
150 | **Registered as** | `"validation"` |
151 | **Purpose** | Deterministic SQL safety gate – zero LLM calls |
152 | **Protection** | Marked protected in CLAUDE.md – any relaxation requires security review |
153
154 **Input kwargs:** `sql: str | None`, `tenant_id: str = "default"`, `user_roles: list[str] | None`, `connector=None` (optional read connector with `explain(sql)` – ChatService passes one so the EXPLAIN dry-run runs under the RLS tenant GUC)
155
156 **Seven safety checks (sequential):**
157 1. **Multi-statement injection** – detects `;-` delimited statements outside string literals
158 2. **Destructive patterns** – 17 hard-blocked (DROP, DELETE, TRUNCATE, ALTER, UPDATE, INSERT, CREATE, GRANT, REVOKE, COPY FROM, ...) + 4 warned (UPDATE, INSERT, CREATE TABLE, CREATE INDEX shapes)
159 3. **Read-only enforcement** – only `SELECT`, `WITH`, `EXPLAIN`, `SHOW`, `DESCRIBE` pass
160 4. **Timeout policy** – metadata only (`statement_timeout: "30s"` in output); enforced by the connector via `SET LOCAL` at execution time. The validator never mutates the SQL (a regression test pins this)
161 5. **Basic sanity** – requires FROM/WHERE (currently always returns True)
162 6. **EXPLAIN dry-run** – runs `EXPLAIN (FORMAT JSON)` via the connector when the SQL is otherwise valid; fail-open (EXPLAIN problems never block)
163 7. **Row count estimate** – >1M estimated rows sets `requires_confirmation: true` + an advisory warning; the pipeline then stops before execution until the client re-sends with `confirm_large_query: true` (Phase 13)
164
165 **Output:** `AgentResult.success` is the pass/fail verdict. `output` carries `validated_sql` (clean, unmutated), `statement_timeout`, `explain_plan`, `row_estimate`, `requires_confirmation`. The SSE `validation` event surfaces `valid`, `validated_sql`, `requires_confirmation`, `row_estimate`, `warnings`.
166
167 ---
168
169 ### 4. ChartGenAgent
170
171 | Attribute | Value |
172 | ---|---|
173 | **Registered as** | `"chart_gen"` |
174 | **Purpose** | Generate chart specifications from data and render via Flint MCP |
175 | **LLM** | `settings.LLM_FAST_MODEL` (Haiku-4), thinking=False, temp=0, max_tokens=2048 |
176
177 **Input kwargs:** `data: list[dict] | None`, `query: str | None`, `intent: str | None`, `preferred_chart_type: str | None`, `tenant_id: str = "default"`
178
179 **Pipeline:**
180 1. `_infer_semantic_types(data)` – samples first 20 rows, classifies columns as Category/Quantity/Temporal
181 2. `_suggest_chart_type(data, semantic_types)` – rule-based: Line if temporal+quantity, Bar if single category, Scatter if 2+ quantities, Pie if few rows
182 3. `_suggest_encodings(data, semantic_types, chart_type)` – assigns x (temporal > category), y (first quantity), color
183 4. LLM invocation – produces `ChartAssemblyInput` spec (JSON output, extraction fallbacks)
184 5. `FlintChartBridge.render(spec)` – renders via Flint MCP or Vega-Lite/Altair fallback
185
186 **Dependencies:** `FlintChartBridge` (bridge to Flint/Vega-Lite), `ChartValidator` (post-render hallucination check)
187
188 ##### Chart Subsystem
189
190 The chart subsystem has three files:
191
192 | File | Purpose |

```

```

193 | ---|---|
194 | `chart/flint_bridge.py` | `FlintChartBridge` – renders specs via Flint MCP or Altair/Vega-Lite fallback. 31 supported chart types. Auto-detects Flint
194 | t availability. |
195 | `chart/vis_flint_protocol.py` | Extends DB-GPT's GPT-Vis with `vis-flint` markdown code blocks. Parses, renders, replaces with inline SVG/base64 PNG
195 | . |
196 | `chart/flint_operator.py` | AWEL-compatible operator for DB-GPT Flow Canvas. Wraps ChartGenAgent + FlintChartBridge. |
197 |
198 | See: [ADR 001](adr/001-dual-chart-stack.md) | [ADR 003](adr/003-vis-flint-protocol.md) | [ADR 004](adr/004-flint-bridge-fallback.md)
199 |
200 | ---
201 |
202 | ### 5. NarrativeAgent
203 |
204 | | Attribute | Value |
205 | |---|---|
206 | | **Registered as** | `"narrative"` |
207 | | **Purpose** | Data storytelling – 3-5 sentence insight paragraphs for business stakeholders |
208 | | **LLM** | `settings.LLM_FAST_MODEL` (Haiku-4), thinking=False, temp=0.3, max_tokens=512 |
209 | | **Prompt** | `.claude/prompts/narrative-system.md` |
210 |
211 | **Input kwargs:** `query: str`, `data_summary: dict | None`, `chart_context: dict | None`, `sql: str`, `tenant_id: str`, `user_id: str`, `session_id:
211 | str`
212 |
213 | **Quality checks** (`_quality_checks(narrative) -> list[str]`):
214 | 1. **Length:** 2-8 sentences ideal; warns if shorter or longer
215 | 2. **Vague language:** flags "many", "large", "significant", "substantial", "most", "some", "few", "various", "generally", "typically"
216 |
217 | ---
218 |
219 | ### 6. Chart Validator (Deterministic)
220 |
221 | | Attribute | Value |
222 | |---|---|
223 | | **Purpose** | Catch and correct LLM hallucinations in chart specifications – zero LLM calls |
224 | | **Philosophy** | Correction over rejection – prefers fuzzy-match fix over failing the request |
225 |
226 | **Validation categories:**
227 |
228 | | Function | What it checks |
229 | |---|---|
230 | | `validate_spec_structure` | Missing required keys, empty data, no encodings |
231 | | `validate_data_size` | >10K rows (warn), 0 rows (error) |
232 | | `validate_field_existence` | Encoding fields match actual data columns; fuzzy-match correction |
233 | | `validate_chart_type_compatibility` | Type compatibility per chart-type requirements |
234 | | `validate_data_ranges` | Negative business metrics, axis bounds vs data range |
235 | | `validate_null_handling` | >20% null values in an encoding field |
236 |
237 | **Correction fallback chain:** Pie → Bar, Scatter → Line → Bar, Line → Bar, Heatmap → Table, universal → Bar.
238 |
239 | ---
240 |
241 | ## Pipeline Data Flow
242 |
243 | ```
244 | User Query
245 | |
246 | | RouterAgent._classify_intent(query) [Haiku, no thinking]
247 | | Returns: "chat_data", dispatch=["nl2sql", "validation", "chart_gen", "narrative"]
248 | |
249 | | CubeClient.get_agent_context(query) [Semantic layer – cached metric definitions]
250 | |
251 | | NL2SQLAgent.execute(query, ...) [Opus, thinking, structured JSON]
252 | | Output: {sql, explanation, tables_used, assumptions}
253 | |
254 | | ValidationAgent.execute(sql) [Deterministic – 7 checks]
255 | | Output: {validated_sql, is_valid}
256 | |
257 | | PostgreSQLConnector.execute(sql) [Read-only, 30s timeout]
258 | | Output: rows (list[dict])
259 | |
260 | | ChartGenAgent.execute(data=rows) [Haiku, no thinking]
261 | | | _generate_chart_spec() → spec
262 | | | FlintChartBridge.render(spec) → SVG/PNG
263 | | | ChartValidator.validate_chart_spec(spec, data) → corrected spec
264 | | | Output: {chart_spec, image_base64/svg}
265 | |
266 | | NarrativeAgent.execute(...) [Haiku, temp=0.3, max_tokens=512]
267 | | Output: {narrative}
268 | |
269 | ```
270 |
271 | ## LLM Model Usage Summary
272 |
273 | | Agent | Model | Thinking | Temperature | Max Tokens | Prompt |
274 | |---|---|---|---|---|---|
275 | | RouterAgent | Haiku-4 | No | 0.0 | 256 | Inline |
276 | | NL2SQLAgent | Opus-4 | **Yes** | 0.0 | 4096 | `.claude/prompts/nl2sql-system.md` |
277 | | ValidationAgent | *None* | N/A | N/A | N/A | N/A |
278 | | ChartGenAgent | Haiku-4 | No | 0.0 | 2048 | Inline |
279 | | NarrativeAgent | Haiku-4 | No | 0.3 | 512 | `.claude/prompts/narrative-system.md` |
280 | | ChartValidator | *None* | N/A | N/A | N/A | N/A |
281 |
282 | ## Design Principles
283 |
284 | 1. **Two-tier LLM usage** – reasoning tasks use Opus with thinking; fast tasks use Haiku
285 | 2. **Deterministic safety gates** – SQL and chart validation run zero LLM calls
286 | 3. **Defense in depth** – NL2SQLAgent has its own destructive-pattern check; ValidationAgent runs independent checks downstream
287 | 4. **Registry pattern** – agents self-register via decorator; no central registration file
288 | 5. **Prompt-as-code** – system prompts live in `.claude/prompts/*.md`, versioned in git
289 | 6. **Structured output** – NL2SQL and Chart Gen both request JSON output with extraction fallbacks
290 | 7. **Correction over rejection** – Chart Validator prefers fixing hallucinations over failing

```

docs/api-reference.md

```

1 | # API Reference
2 |
3 | > **Base URL:** `http://localhost:8000/api/v1` | **Auth:** JWT Bearer token | **Content-Type:** `application/json`
4 |
5 | ## Authentication
6 |
7 | All endpoints except health checks require a JWT Bearer token in the `Authorization` header:
8 | ...
9 |
10 | Authorization: Bearer <token>
11 | ...
12 |
13 | The token is obtained via `POST /auth/login` (below).
14 |
15 | **Token payload:**
16 | ```json
17 | {
18 |   "sub": "<user_id>",
19 |   "tenant_id": "<tenant_id>",
20 |   "roles": ["user"],
21 |   "exp": 1234567890,
22 |   "iat": 1234567890
23 | }
24 | ```
25 |
26 | On failure (missing, expired, or invalid token): HTTP 401 with:
27 | ```json
28 | {"code": "INVALID_TOKEN", "message": "Missing, expired, or invalid authentication token"}
29 | ```
30 |
31 | **Implementation status key:** = fully implemented, = stub
32 |
33 | ---
34 |
35 | ## Auth
36 |
37 | ### `POST /auth/login`
38 |   **Authenticate a user by email + password and receive a JWT access token.**
39 |
40 | **Request:** `LoginRequest`
41 | ```json
42 | {
43 |   "email": "admin@genbi.local",
44 |   "password": "admin123"
45 | }
46 | ```
47 |
48 | | Field | Type | Constraints |
49 | |---|---|---|
50 | | `email` | `string` | Required, 3-255 chars (normalized to lowercase) |
51 | | `password` | `string` | Required, 6-128 chars |
52 | | `tenant_id` | `string` \| `null` | Optional UUID – required only when the same email exists in multiple tenants |
53 |
54 | **Response:** `LoginResponse`
55 | ```json
56 | {
57 |   "access_token": "eyJhbGciOiJIUzI1NiIs... ",
58 |   "token_type": "bearer",
59 |   "user": {
60 |     "id": "00000000-0000-0000-0000-000000000101",
61 |     "email": "admin@genbi.local",
62 |     "name": "admin",
63 |     "tenant_id": "00000000-0000-0000-0000-000000000001",
64 |     "roles": ["admin", "user"]
65 |   }
66 | }
67 | ```
68 |
69 | | Field | Type | Notes |
70 | |---|---|---|
71 | | `access_token` | `string` | JWT, signed with `JWT_SECRET_KEY`; accepted by every protected endpoint |
72 | | `user.name` | `string` | Derived from the email local-part (the `users` table has no name column) |
73 |
74 | **Errors:** `401` with `{ "code": "INVALID_CREDENTIALS", "message": "Invalid email or password" }` for wrong credentials, unknown email, ambiguous multi-tenant email, or an invalid `tenant_id`. `429` with `{ "code": "TOO_MANY_ATTEMPTS", ... }` after 5 failed attempts for the same email within 15 minutes (counter resets on success).
75 |
76 | ---
77 |
78 | ## Health
79 |
80 | > No auth required.
81 |
82 | ### `GET /health`
83 |   **Liveness probe.** Returns 200 if the server is running.
84 |
85 | **Response:**
86 | ```json
87 | {"status": "ok", "version": "0.1.0"}
88 | ```
89 |
90 | ### `GET /health/ready`
91 |   **Readiness probe.** Pings Postgres and Redis for real; returns 200 only when both are reachable, 503 otherwise (the probe used by Docker healthchecks and `make verify`).
92 |
93 | **Response:**
94 | ```json
95 | {"status": "ready", "database": "connected", "redis": "connected", "mcp_flint": "configured"}
96 | ```
97 |

```

```

98 | ---
99 |
100 | ## Chat
101 |
102 | > `Authorization: Bearer <token>` required.
103 |
104 | ### `POST /chat`
105 | Main NL-to-SQL endpoint. Returns SQL, chart spec, and narrative in a single response.
106 |
107 | **Request:** `ChatRequest`
108 | ```json
109 | {
110 |   "query": "Show total revenue by region for Q3",
111 |   "conversation_id": null
112 | }
113 | ```
114 |
115 | | Field | Type | Constraints |
116 | |---|---|---|
117 | | `query` | `string` | Required, 1-5000 chars |
118 | | `conversation_id` | `string` | `null` | Optional UUID for multi-turn |
119 | | `confirm_large_query` | `bool` | Default false – set true to proceed when the EXPLAIN row estimate exceeds 1M (see below) |
120 |
121 | **Response:** `ChatResponse`
122 | ```json
123 | {
124 |   "conversation_id": "550e8400-e29b-41d4-a716-446655440000",
125 |   "query": "Show total revenue by region for Q3",
126 |   "sql": "SELECT region, SUM(revenue_amount) as total_revenue FROM transactions WHERE ...",
127 |   "sql_explanation": "This query groups revenue by region using the transactions table...",
128 |   "chart_spec": {"chartType": "Bar Chart", "encodings": {...}},
129 |   "narrative": "Revenue in Q3 was highest in the Northeast region at $4.2M...",
130 |   "chart_image_base64": null,
131 |   "warnings": [],
132 |   "requires_confirmation": false,
133 |   "row_estimate": 1200
134 | }
135 | ```
136 |
137 | **Large-query confirmation:** when the validated SQL's EXPLAIN estimate exceeds 1M rows, the response returns early with `requires_confirmation: true`
138 | , `row_estimate`, the SQL, and warnings – no data, chart, or narrative. Re-send the same query with `confirm_large_query: true` to execute.
139 |
140 | | Field | Type | Notes |
141 | |---|---|---|
142 | | `conversation_id` | `string` | UUID generated per session |
143 | | `query` | `string` | Echoes the input query |
144 | | `sql` | `string` | `null` | Generated read-only SQL |
145 | | `sql_explanation` | `string` | `null` | Plain-English explanation |
146 | | `chart_spec` | `dict` | `null` | Flint `ChartAssemblyInput` schema |
147 | | `narrative` | `string` | `null` | 3-5 sentence insight paragraph |
148 | | `chart_image_base64` | `string` | `null` | Rendered chart (PNG) |
149 | | `warnings` | `string[]` | Advisory messages |
150 |
151 | ### `POST /chat/feedback`
152 | Record thumbs-up/down feedback on a chat response (Phase 15).
153 |
154 | **Request:** `{ "session_id": "<uuid>", "score": 1 }` – score: `1` up, `-1` down, `0` clear. The `session_id` is the one from the SSE `start` event / sy
155 | nc response (NOT the conversation id).
156 |
157 | The score lands on the audit rows of the session (`audit_log.feedback_score`), completing the governance loop.
158 |
159 | Errors: `503` `FEEDBACK_UNAVAILABLE` (no matching audit rows or store unreachable), `422` validation.
160 |
161 | ### `POST /chat/stream`
162 | **Streaming variant.** Returns SSE events as the agent pipeline progresses.
163 |
164 | **Request:** Same as `POST /chat`.
165 |
166 | **Response:** `text/event-stream` – each event is `data: {json}\n\n`.
167 |
168 | **SSE Event Types:**
169 |
170 | | Event | Fields | Description |
171 | |---|---|---|
172 | | `start` | `conversation_id`, `query` | Pipeline started |
173 | | `intent` | `intent`, `dispatch_plan` | Router classified the query |
174 | | `sql` | `sql`, `warnings` | NL2SQL agent generated SQL |
175 | | `validation` | `valid`, `validated_sql`, `requires_confirmation`, `row_estimate`, `warnings` | Validation gate (EXPLAIN-backed) |
176 | | `data` | `row_count`, `warnings` | Query executed, data returned |
177 | | `chart` | `chart_spec`, `image_base64`, `svg` | Chart generated + rendered |
178 | | `narrative` | `narrative`, `warnings` | Narrative agent wrote insight |
179 | | `done` | `status`, `warnings` | Pipeline complete |
180 |
181 | **Example SSE stream:**
182 | ```
183 | data: {"event":"start","conversation_id":"...", "query":"Show revenue by region"}
184 |
185 | data: {"event":"intent","intent":"chat_data","dispatch_plan":["nl2sql","validation","chart_gen","narrative"]}
186 |
187 | data: {"event":"sql","sql":"SELECT region, SUM(revenue_amount) AS total FROM ...","warnings":[]}
188 |
189 | data: {"event":"validation","valid":true,"validated_sql":"SELECT region, SUM(revenue_amount) AS total FROM ...","requires_confirmation":false,"row_est
190 | imate":1200,"warnings":[]}
191 |
192 | data: {"event":"done","status":"complete","warnings":[]}
193 | ```

199|
200| ## Charts
201|
202| > `Authorization: Bearer <token>` required.
203|
204| ### `POST /charts/render`
205|   Render a chart from a `ChartAssemblyInput` spec. Supports Vega-Lite, ECharts, and Chart.js backends.
206|
207| **Request:** `ChartRenderRequest`
208| ```json
209| {
210|   "spec": {
211|     "chartType": "Bar Chart",
212|     "encodings": {
213|       "x": {"field": "region"},
214|       "y": {"field": "revenue_total"}
215|     },
216|     "baseSize": {"width": 600, "height": 400},
217|     "semantic_types": {"region": "Category", "revenue_total": "Quantity"},
218|     "data": {
219|       "values": [
220|         {"region": "Northeast", "revenue_total": 4200000},
221|         {"region": "West", "revenue_total": 3100000}
222|       ]
223|     },
224|     "backend": "vegalite",
225|     "format": "png"
226|   }
227| }
228| ```
229|
230| | Field | Type | Default | Notes |
231| |---|---|---|---|
232| | `spec.chartType` | `string` | - | Bar, Line, Scatter, Pie, Area, etc. (31 supported) |
233| | `spec.encodings` | `dict` | - | Field → channel mappings (`x`, `y`, `color`, `size`, etc.) |
234| | `spec.baseSize` | `{width, height}` | `{600, 400}` | Output dimensions |
235| | `spec.semantic_types` | `dict` | - | Field types: `Category`, `Quantity`, `Temporal` |
236| | `spec.data.values` | `object[]` | - | Inline data rows (≤ 100 rows; larger → temp file) |
237| | `spec.data.url` | `string` | - | Alternative: file URL for large datasets |
238| | `backend` | `string` | `vegalite` | `vegalite`, `echarts`, or `chartjs` |
239| | `format` | `string` | `png` | `png` or `svg` |
240|
241| **Response:** `ChartRenderResponse`
242| ```json
243| {
244|   "success": true,
245|   "format": "png",
246|   "image_base64": "iVBORw0KGgoAAAANSUHEUgA...",
247|   "svg": null,
248|   "warnings": [],
249|   "errors": []
250| }
251| ```
252|
253| ---
254|
255| ## Conversations
256|
257| > Multi-turn chat history (Phase 14). Requires `Authorization: Bearer <token>`.
258|
259| ### `GET /conversations`
260|   List the current user's conversations, most recently active first (RLS tenant-scoped + per-user).
261|
262| **Response:** `{conversations: [{id, title, created_at, updated_at}], count}`
263|
264| Errors: `503` `PERSISTENCE_UNAVAILABLE` when the store is unreachable.
265|
266| ### `GET /conversations/{conversation_id}/messages`
267|   A conversation's turns in chronological order (most recent 50 by default). Other tenants' ids return zero messages (RLS).
268|
269| **Response:** `{messages: [{role, content, generated_sql?, created_at}], count}`
270|
271| Errors: `400 INVALID_CONVERSATION` (malformed id), `503 PERSISTENCE_UNAVAILABLE`.
272|
273| **Multi-turn flow:** send chat requests with the same `conversation_id`; the NL2SQL agent receives the prior turns as a "Conversation History" prompt section (follow-ups like "now break that down by region" work). The SSE `start` event carries the resolved `conversation_id`; turns persist automatically (fail-open).
274|
275| ---
276|
277| ## Datasources
278|
279| ### `GET /datasources`
280|   List the semantic layer's cubes for the current tenant (from Cube `meta`).
281|
282| **Response:**
283| ```json
284| {
285|   "datasources": [
286|     {"name": "Sales", "title": "Sales", "measures": 4, "dimensions": 4}
287|   ],
288|   "count": 1
289| }
290| ```
291|
292| Errors: `503` `{detail: {"code": "CUBE_UNAVAILABLE", ...}}` when Cube is unreachable.
293|
294| ### `POST /datasources/test`
295|   Stub. Targets a different feature (admin-configured external warehouses), not the built-in semantic-layer source.
296|
297| ---
298|
299| ## Metrics
300|
301| ### `GET /metrics/list`

```

```

302 | List all metrics from the semantic layer (catalog of 10 cubes / 23 measures).
303
304 **Response:** `{metrics: [{name, title, description, metric_type, cube_name, measure_name, dimensions, time_dimensions}], count}`
305
306 ### `POST /metrics/query`
307 Execute a **tenant-scoped** metric query against Cube.dev (ADR 008: the JWT's tenant claim drives Cube's per-tenant driver and its RLS GUC – results
307 are isolated at the database layer).
308
309 **Request:**
310 ```json
311 {
312   "measures": ["Sales.revenue_total"],
313   "dimensions": ["Sales.region"],
314   "time_dimensions": [{"dimension": "Sales.transaction_date", "granularity": "month"}],
315   "limit": 100
316 }
317 ```
318
319 | Field | Type | Constraints |
320 |---|---|---|
321 | `measures` | `string[]` | 1-5, must exist in the catalog (`400 INVALID_METRIC` otherwise) |
322 | `dimensions` | `string[]` | ≤ 5 group-bys |
323 | `time_dimensions` | `[{dimension, granularity, date_range}]` | ≤ 3; granularity: day/week/month/quarter/year/hour |
324 | `filters` | `[{member, operator, values}]` | Cube filter syntax |
325 | `order` | `[[field, dir]]` | e.g. `[["Sales.revenue_total", "desc"]]` |
326 | `limit` / `offset` | `int` | 1-1000 / ≥ 0 |
327 | `timezone` | `string` | default `UTC` |
328
329 **Response:** `{data: [...flattened rows...], annotation, total, query, latency_ms, cached}` – row keys are stripped of cube prefixes. Results are cac
329 hed per tenant for 300s (same query → `cached: true`).
330
331 Errors: `400 INVALID_METRIC`, `503 CUBE_UNAVAILABLE`, `422` validation.
332
333 ---
334
335 ## Reports
336
337 > Multi-chart reports (Phase 16). Requires `Authorization: Bearer <token>`.
338
339 ### `POST /reports/generate`
340 Generate a multi-chart report from a natural language prompt.
341
342 LLM-planned (one fast-model call picks 2-4 metrics from the semantic-layer catalog) with deterministic execution: per-section tenant-scoped Cube query
342 → chart render → one overall narrative. Sections that return no data are skipped with a warning; the report persists best-effort.
343
344 **Request:**
345 ```json
346 {"prompt": "Q3 performance: revenue, pipeline, and active users", "max_sections": 3}
347 ```
348
349 | Field | Type | Constraints |
350 |---|---|---|
351 | `prompt` | `string` | Required, 1-2000 chars |
352 | `max_sections` | `int` | 2-4, default 3 |
353
354 **Response:** `ReportOut` – `{report_id, title, prompt, summary?, status, created_at, sections: [{position, metric_name, section_title, chart_spec, ch
354 art_svg?, data_total?, row_count, narrative?}], warnings}`
355
356 Errors: `503` `REPORT_GENERATION_FAILED` (planning/exec failure), `422` validation.
357
358 ### `GET /reports`
359 List the current user's reports, newest first.
360
361 **Response:** `{reports: [{id, title, created_at, section_count}], count}`
362
363 Errors: `503` `PERSISTENCE_UNAVAILABLE`.
364
365 ### `GET /reports/{report_id}`
366 Retrieve a persisted report (RLS tenant-scoped).
367
368 **Response:** same `ReportOut` shape as generate.
369
370 Errors: `400` `INVALID_REPORT` (malformed id), `404` `REPORT_NOT_FOUND`, `503` `PERSISTENCE_UNAVAILABLE`.
371
372 ---
373
374 ## Error Format
375
376 All error responses follow this shape:
377
378 ```json
379 {
380   "detail": {
381     "code": "ERROR_CODE",
382     "message": "Human-readable description of what went wrong"
383   }
384 }
385 ```
386
387 **Common error codes:**
388
389 | Code | HTTP Status | Context |
390 |---|---|---|
391 | `INVALID_TOKEN` | 401 | Missing, expired, or invalid JWT |
392 | `VALIDATION_FAILED` | 422 | Request body fails Pydantic validation |
393 | `NOT_FOUND` | 404 | Resource doesn't exist |
394 | `INTERNAL_ERROR` | 500 | Unexpected server error |
395
396 ## Pydantic Models (reference)
397
398 ### `ChatRequest`
399 ```python
400 class ChatRequest(BaseModel):
401     query: str = Field(..., min_length=1, max_length=5000)
402     conversation_id: str | None = Field(None)

```

```
403| '''
404|
405| ### `ChartAssemblyInput`
406| ```python
407| class ChartAssemblyInput(BaseModel):
408|     chartType: str
409|     encodings: dict # Record[str, FieldSpec]
410|     baseSize: dict # {"width": int, "height": int}
411|     semantic_types: dict[str, str] | None
412|     data: dict # {"values": list[dict]} or {"url": str}
413| ```
414|
415| ### `ChartRenderRequest`
416| ```python
417| class ChartRenderRequest(BaseModel):
418|     spec: ChartAssemblyInput
419|     backend: str = Field(default="vegalite")
420|     format: str = Field(default="png")
421| ```
```

1 | # Architecture Overview
2 |
3 | > See also: [ADR 002: Multi-Agent Architecture](adr/002-agent-architecture.md) | [ADR 001: Dual Chart Stack](adr/001-dual-chart-stack.md)
4 |
5 | ## Four-Tier Architecture
6 |
7 | ...
8 |
9 | Layer 1: Interface
10 | Next.js 15 App Router · shadcn/ui · SSE
11 |
12 | Layer 2: Orchestration (LangGraph Agents)
13 |
14 | NL2SQL Agent | ChartGen Agent | Narrative Agent
15 |
16 |
17 | Layer 3: Semantic Layer
18 | dbt MetricFlow → Cube.dev → CubeClient
19 |
20 | Layer 4: Data Retrieval
21 | PostgreSQL · pgvector · Apache AGE
22 |
23 | Layer 5: Governance & Audit
24 | AuditLog · Langfuse · Prompt logs
25 |
26 | ...
27 |
28 |
29 | ## Layer 1 – Interface
30 |
31 | - **Framework:** Next.js 15 App Router, React 19, TypeScript 5.9
32 | - **Styling:** Tailwind CSS v4 with a custom `brand` palette, shadcn/ui component primitives
33 | - **Streaming:** SSE (`text/event-stream`) from backend agent pipeline to chat UI
34 | - **Auth:** JWT-based with `AuthProvider` + `AuthGuard` wrapping the chat interface
35 | - **Charts:** Rendered as SVG (inline `dangerouslySetInnerHTML`) or base64 PNG from Flint/Altair bridge
36 |
37 | See: [Frontend Guide](frontend-guide.md)
38 |
39 | ## Layer 2 – Orchestration
40 |
41 | Six specialized agents orchestrated by LangGraph, inspired by DB-GPT's AWEL patterns:
42 |
43 | | Agent | Input | Output | Model |
44 | |---|---|---|---|
45 | | `RouterAgent` | User query | Intent + dispatch plan | Haiku-4 |
46 | | `NL2SQLAgent` | Query + schema context + metrics | SQL + explanation + table list | Opus-4 (thinking) |
47 | | `ValidationAgent` | Generated SQL | Safety verdict + validated SQL | Deterministic |
48 | | `ChartGenAgent` | Result set + intent | Flint ChartAssemblyInput spec + rendered image | Haiku-4 |
49 | | `NarrativeAgent` | Data summary + chart context | 3-5 sentence insight paragraph | Haiku-4 |
50 | | `ChartValidator` | Chart spec + data | Validation issues + corrected spec | Deterministic |
51 |
52 | The pipeline is conditionally routed: not every query needs all agents. The `RouterAgent` classifies intent (`chat_data`, `chat_visualize`, `chat_report`, `chat_knowledge`, `chat_explore`) and the orchestrator skips irrelevant stages.
53 |
54 | See: [Agent System](agent-system.md)
55 |
56 | ## Layer 3 – Semantic Layer
57 |
58 | Three-tier pipeline ensuring metrics are defined once and consumed everywhere:
59 |
60 | 1. **dbt MetricFlow** (`semantic/dbt/`) – Source-of-truth metric definitions, staging models, dimension/measure/entity specifications
61 | 2. **Cube.dev** (`semantic/cube/`) – REST + GraphQL API exposing those metrics to agents and frontend
62 | 3. **CubeClient** (`backend/app/semantic/`) – Async Python client with metric-to-LLM formatting
63 |
64 | Column descriptions from dbt `schema.yml` are injected into LLM context. Schema embeddings are synced to pgvector nightly via `scripts/embed_schema.py`.
65 |
66 | See: [Semantic Layer](semantic-layer.md)
67 |
68 | ## Layer 4 – Data Retrieval
69 |
70 | - **Primary store:** PostgreSQL 16 with extensions: `pgvector` (schema embeddings, semantic search), `apache_age` (graph queries for lineage/impact analysis)
71 | - **Connectors:** `BaseConnector` → `PostgreSQLConnector` (read-only). All queries are read-only, capped at 30s via `SET LOCAL statement_timeout`, and injected with `SET TRANSACTION READ ONLY`
72 | - **Cache:** Dual-tier – L1 (in-memory LRU, 1000 entries) + L2 (Redis, shared across instances)
73 | - **Session:** Async SQLAlchemy with `asyncpg` driver
74 |
75 | See: [Data Layer](data-layer.md) | [Core Services](core-services.md#4-cache-service)
76 |
77 | ## Layer 5 – Governance & Audit
78 |
79 | Every LLM call produces an `AuditLog` entry: session_id, user_id, tenant_id, hashed prompt, generated SQL, model name/version, token counts, latency. Langfuse provides LLM tracing. OpenTelemetry spans wrap agent calls and DB queries. Prometheus metrics export via `/metrics`.
80 |
81 | ## Data Flow (Full Pipeline)
82 |
83 | ...
84 | User Query (ChatView)
85 | → POST /api/v1/chat/stream (SSE)
86 | → ChatService.process_query_stream()
87 |   | RouterAgent → intent: "chat_data"
88 |   | CubeClient → metric definitions for LLM context
89 |   | NL2SQLAgent → SQL (Opus-4, thinking, temp=0)
90 |   | ValidationAgent → safety check (deterministic)
91 |   | PostgreSQLConnector → read-only execution (30s timeout)
92 |   | ChartGenAgent → ChartAssemblyInput + Flint/Altair render (Haiku-4)
93 |   | ChartValidator → hallucination detection + auto-correct
94 |   | NarrativeAgent → insight text (Haiku-4, temp=0.3)
95 | → SSE events: intent → sql → validation → data → chart → narrative → done

```

```

96 | → ChatView renders incrementally (stage badges, SQL block, chart card, narrative)
97 | ...
98 |
99 | ## Project Structure

139 |
140 | ## Key Design Decisions
141 |
142 | | Decision | ADR | Rationale |
143 | |----|----|----|
144 | | Multi-agent over monolithic | [002](adr/002-agent-architecture.md) | Specialized prompts, per-stage model selection, independent testing |
145 | | LangGraph over raw chains | [002](adr/002-agent-architecture.md) | Conditional routing, checkpointing, per-agent streaming |
146 | | Flint MCP + AntV G2 dual stack | [001](adr/001-dual-chart-stack.md) | Flint for static export, G2 for interactive dashboards |
147 | | Vega-Lite (Altair) fallback | [004](adr/004-flint-bridge-fallback.md) | Ship without Flint dependency; same schema regardless of renderer |
148 | | Deterministic safety gates | N/A | SQL validation and chart validation use pure rules – zero LLM calls, zero hallucination risk |
149 | | Correction over rejection | N/A | Chart validator prefers fuzzy-match fix + chart-type downgrade over failing the request |
150 | | Read-only by default | N/A | All connectors enforce read-only; writes require explicit service methods with auth |

1 | # Core Services
2 |
3 | > Backend infrastructure: configuration, logging, LLM client, caching, authentication, PII masking, observability.
4 |
5 | ---
6 |
7 | ## 1. Configuration
8 |
9 | **File:** `backend/app/core/config.py` | **Type:** `pydantic-settings.BaseSettings`
10 |
11 | Singleton: `settings = Settings()` – imported project-wide. Loads from `.env` with `extra="ignore"`.
12 |
13 | | Category | Key | Default | Purpose |
14 | |---|---|---|---|
15 | | App | `APP_ENV` | `"development"` | `development` / `staging` / `production` |
16 | | App | `DEBUG` | `True` | Debug mode toggle |
17 | | App | `LOG_LEVEL` | `"DEBUG"` | loguru log level |
18 | | App | `CORS_ORIGINS` | `["http://localhost:3000"]` | Allowed CORS origins |
19 | | LLM | `ANTHROPIC_API_KEY` | `""` | Anthropic API key |
20 | | LLM | `LLM_REASONING_MODEL` | `"claude-opus-4"` | Used for NL2SQL (thinking enabled) |
21 | | LLM | `LLM_FAST_MODEL` | `"claude-haiku-4"` | Used for routing, charts, narrative |
22 | | Database | `DATABASE_URL` | `postgresql+asyncpg://genbi:genbi@localhost:5432/genbi` | Async connection |
23 | | Database | `DATABASE_URL_SYNC` | `postgresql+psycopg2://genbi:genbi@localhost:5432/genbi` | Sync (Alembic) |
24 | | Redis | `REDIS_URL` | `redis://localhost:6379/0` | Cache + session store |
25 | | Semantic | `CUBE_API_URL` | `http://localhost:4000/cubejs-api/v1` | Cube.dev REST endpoint |
26 | | Semantic | `CUBE_API_SECRET` | `""` | Cube API auth |
27 | | Obs. | `LANGFUSE_SECRET_KEY` | `""` | Langfuse LLM tracing |
28 | | Obs. | `LANGFUSE_PUBLIC_KEY` | `""` | Langfuse public key |
29 | | Obs. | `LANGFUSE_HOST` | `https://cloud.langfuse.com` | Langfuse instance |
30 | | Auth | `JWT_SECRET_KEY` | `change-me` | HS256 signing key |
31 | | Auth | `JWT_ALGORITHM` | `HS256` | JWT algorithm |
32 | | Auth | `JWT_EXPIRE_MINUTES` | `60` | Token lifetime |
33 | | Tenant | `TENANT_ENCRYPTION_KEY` | `""` | PII encryption key |
34 | | Flint | `FLINT_MCP_BACKENDS` | `vegalite,echarts,chartjs` | Enabled chart backends |
35 | | Flint | `FLINT_MCP_DATA_ROOTS` | `/tmp/genbi-charts` | Temp data directory |
36 |
37 | ---
38 |
39 | ## 2. Logging
40 |
41 | **File:** `backend/app/core/logging.py`
42 |
43 | Uses **loguru** (not stdlib logging). A single shared `logger` instance.
44 |
45 | ```python
46 | from app.core.logging import logger
47 | logger.info("LLM call complete", model="claude-opus-4", latency_ms=1200)
48 | ```
49 |
50 | **`setup_logging()`** – called once at app startup:
51 | - **Development:** colored stdout at `settings.LOG_LEVEL`
52 | - **Production:** adds daily-rotated JSON file output to `logs/genbi_*.json`, 30-day retention
53 |
54 | ---
55 |
56 | ## 3. LLM Client
57 |
58 | **File:** `backend/app/core/llm_client.py`
59 |
60 | ### `LLMClient` (singleton)
61 |
62 | All agent LLM calls route through `get_llm_client()`.
63 |
64 | **Primary method:**
65 | ```python
66 | async def invoke(
67 |     self,
68 |     messages: list[dict],
69 |     system: str,
70 |     use_reasoning: bool = False,
71 |     options: LLMCallOptions | None = None,
72 |     user_id: str = "",
73 |     tenant_id: str = "",
74 |     session_id: str = "",
75 |     generated_sql: str = "",
76 | ) -> LLMCallResult
77 | ```
78 |
79 | **Behavior:**
80 | - `use_reasoning=True` → selects `LLM_REASONING_MODEL` (Opus-4), forces `thinking=True` and `temp=0.0`
81 | - `use_reasoning=False` → selects `LLM_FAST_MODEL` (Haiku-4)
82 | - **Retry:** up to 3 attempts, exponential backoff with jitter `(min(2^attempt + random, 30)` seconds)
83 | - **JSON extraction:** three strategies – pure JSON, ```json``` code block, first `{...}` pair
84 | - **Token budget:** warns via logger if `input+output > token_budget` (default 100K)
85 | - **Audit logging:** calls audit callback after each successful invocation (SHA-256 of the prompt text – never raw – user/tenant/session context, token counts, latency, generated SQL). Since Phase 12 the callback is wired at app startup to `app/services/audit.py:write_audit_entry`, which persists one `audit_log` row per LLM call (asyncpg on `genbi_app`, tenant GUC set per row, fail-open).
86 |
87 | ### `LLMCallOptions`
88 | ```python
89 | @dataclass
90 | class LLMCallOptions:
91 |     temperature: float = 0.0
92 |     max_tokens: int = 4096
93 |     thinking: bool = False
94 |     response_format: str | None = None # "json" triggers structured output extraction
95 |     timeout_seconds: int = 60
96 |     max_retries: int = 3
97 |     token_budget: int = 100_000
98 | ```

```

```

99 |
100 | ### `load_prompt(name: str) -> str`
101 | Reads from `.claude/prompts/{name}.md` relative to project root.
102 |
103 | **Dependencies:** `langchain_anthropic.ChatAnthropic`, `settings.ANTHROPIC_API_KEY`.
104 |
105 | ---
106 |
107 | ## 4. Cache Service
108 |
109 | **File:** `backend/app/core/cache.py` | **Architecture:** Dual-tier (L1 in-memory LRU + L2 shared Redis)
110 |
111 | ### Cache TTLs (`CacheTTL`)
112 |
113 | | Constant | Value | Purpose |
114 | |---|---|---|
115 | | `SCHEMA_EMBEDDINGS` | 24h | Nightly-synced from information_schema |
116 | | `METRIC_DEFINITIONS` | 5 min | Cube.dev `/meta` response |
117 | | `QUERY_RESULTS` | 5 min | Read-heavy analytics |
118 | | `LLM_RESPONSE` | 1h | Same query = same SQL at temp=0 |
119 | | `CHART_SPEC` | 1h | Vega-Lite/ECharts specs |
120 | | `RATE_LIMIT` | 1 min | Window counters |
121 | | `SESSION_STATE` | 30 min | Idle session expiry |
122 |
123 | ### `LRUCache` (Level 1)
124 |
125 | In-memory `OrderedDict`-based. Max 1000 entries. TTL-based expiry on `get()`. LRU eviction on `set()` when over capacity.
126 |
127 | ### `RedisCache` (Level 2)
128 |
129 | Lazy-init via `redis.asyncio.from_url(settings.REDIS_URL)`. If Redis is unavailable, all operations become no-ops (graceful degradation).
130 |
131 | ### `CacheService` (Unified facade)
132 |
133 | **Typed get/set pairs (all async):**
134 |
135 | | Method pair | Key pattern | Tier |
136 | |---|---|---|
137 | | `get_schema_context` / `set_schema_context` | `genbi:{tenant}:schema:{query_hash}` | L1+L2 |
138 | | `get_metric_definitions` / `set_metric_definitions` | `genbi:{tenant}:metrics:all` | L1+L2 |
139 | | `get_query_result` / `set_query_result` | `genbi:{tenant}:query:{sql_hash}` | L1+L2 |
140 | | `get_llm_response` / `set_llm_response` | `genbi:{tenant}:llm:{prompt_hash}` | L2 only |
141 | | `get_chart_spec` / `set_chart_spec` | `genbi:{tenant}:chart:{data_hash}` | L1+L2 |
142 | | `get_session` / `set_session` | `genbi:session:{session_id}` | L2 only |
143 | | `check_rate_limit` | `genbi:ratelimit:{user}` | L2 only |
144 |
145 | **Read path:** L1.get() → hit? return. Miss → L2.get() → hit? promote to L1 → return. Miss → return None.
146 |
147 | **Rate limiting:** `check_rate_limit(user_id, max_requests=30, window_seconds=60) → (allowed: bool, remaining: int)`. Uses Redis INCR + EXPIRE. Falls
148 | open (allows all) if Redis is down.
149 |
150 | ---
151 |
152 | ## 5. Authentication
153 |
154 | **File:** `backend/app/core/auth.py`
155 |
156 | ### JWT Creation and Verification
157 |
158 | ```python
159 | from app.core.auth import create_access_token, decode_token
160 |
161 | token = create_access_token(
162 |     user_id="550e8400-e29b-41d4-a716-446655440000",
163 |     tenant_id="00000000-0000-0000-0000-000000000001",
164 |     roles=["user", "analyst"],
165 |     expires_minutes=60
166 | )
167 |
168 | payload = decode_token(token)
169 | # payload = {"sub": "...", "tenant_id": "...", "roles": [...], "exp": ..., "iat": ...}
170 | ```
171 |
172 | ### `get_current_user` Dependency
173 |
174 | FastAPI `Depends(get_current_user)` extracts the Bearer token from `HTTPBearer`, decodes it with `python-jose`, and returns the payload dict. On failure: HTTP 401.
175 |
176 | **Used by:** All API routes except health checks (see [API Reference](api-reference.md)).
177 |
178 | ### Login endpoint
179 |
180 | End users obtain a token via `POST /auth/login` (see [API Reference](api-reference.md#auth)) – bcrypt password check against the `users` table through
181 | the login-only `genbi_auth` DB role (its cross-tenant SELECT is the single RLS carve-out; see [ADR 006](adr/006-enforced-rls-roles.md)). Failed attempts
182 | are rate-limited in Redis (5 failures → 429 for 15 minutes).
183 |
184 | ---
185 |
186 | ## 6. PII Masking
187 |
188 | **File:** `backend/app/core/masking.py`
189 |
190 | ### `PIIMasker`
191 |
192 | Column-level masking for PII fields. Per-tenant, role-aware.
193 |
194 | ```python
195 | masker = PIIMasker() # uses DEFAULT_MASK_RULES
196 | masked_rows = masker.mask_rows(rows)
197 | ```
198 |
199 | **Pre-configured rules** for 14 column name patterns: `email`, `phone`, `ssn`, `credit_card`, `password`, `secret`, `api_key`, `token`, etc.
200 |
201 | **Mask strategies:**
202 | | MaskType | Input | Output |

```

```

200 | ---|---|---|
201 | `EMAIL` | `jdoe@company.com` | `j***@company.com` |
202 | `PHONE` | `+1-555-123-4567` | `***-***-4567` |
203 | `SSN` | `123-45-6789` | `***-**-6789` |
204 | `CREDIT_CARD` | `4111-1111-1111-1111` | `****-****-****-1111` |
205 | `FULL_MASK` | anything | `****` |
206
207 **Tenant-aware routing:**
208 ```python
209 load_tenant_mask_rules(tenant_id, custom_rules)
210 masker = get_masker_for_tenant(tenant_id)
211 ```
212
213 ---
214
215 ## 7. Observability
216
217 **File:** `backend/app/core/observability.py`
218
219 ### Tracing (OpenTelemetry)
220 - `init_tracing()` - creates OTLP gRPC exporter + console exporter (debug), registers `genbi-backend` service
221 - `instrument_app(app)` - auto-instruments FastAPI, HTTPX, and SQLAlchemy
222 - `create_span(name, attributes)` - context manager for manual spans
223 - `get_current_trace_id()` - returns 32-hex OTEL trace ID
224
225 ### Metrics (Prometheus)
226 `init_metrics()` registers these gauges/counters/histograms on the `genbi` meter:
227
228 | Metric | Type | Description |
229 |---|---|---|
230 | `genbi.chat.requests` | Counter | Chat endpoint invocations |
231 | `genbi.chat.latency` | Histogram | End-to-end chat latency (ms) |
232 | `genbi.sql.generated` | Counter | SQL queries produced |
233 | `genbi.sql.validation_failures` | Counter | Failed validation checks |
234 | `genbi.llm.tokens` | Counter | LLM token consumption |
235 | `genbi.llm.latency` | Histogram | Per-LLM-call latency (ms) |
236 | `genbi.cache.hits` | Counter | Cache hit count |
237 | `genbi.cache.misses` | Counter | Cache miss count |
238
239 ### Langfuse (LLM Tracing)
240 `LangfuseTracer.trace_llm_call()` creates a Langfuse trace with a sub-generation span. Truncates I/O to 2000 chars. Gracefully degrades if unavailable
241 .
242 ---
243
244 ## Cross-Cutting Patterns
245
246 **Graceful degradation:** Redis unavailable → no-op caching. Langfuse unavailable → skip tracing. OTEL endpoint missing → skip export. Audit callback
247 failure → log and continue.
248
249 **Singletons:** `get_cache()`, `get_llm_client()`, `get_langfuse_tracer()` use module-level lazy-init (no locking - safe under asyncio).
250
251 **Tenant isolation:** All cache keys embed `{tenant_id}`. JWT tokens carry `tenant_id`. Masking rules are per-tenant. Audit logs link to `tenants` via
252 FK.
253
254 **Async everywhere:** All I/O-bound services use `async`/`await`.

```

1 | # Data Layer
2 |
3 | > ORM models, database sessions, connectors, Apache AGE graph schema, and migrations.
4 |
5 | ---
6 |
7 | ## ORM Models
8 |
9 | **File:** `backend/app/db/models.py`
10 |
11 | ### `Base` – SQLAlchemy `DeclarativeBase`
12 |
13 | ### `Tenant` (table: `tenants`)
14 |
15 | | Column | Type | Notes |
16 | |---|---|---|
17 | | `id` | `UUID` | PK, `uuid4()` default |
18 | | `name` | `String(255)` | Unique, not null |
19 | | `created_at` | `TIMESTAMPZ` | `utcnow()` default |
20 | | `updated_at` | `TIMESTAMPZ` | `utcnow()` default, onupdate |
21 |
22 | ### `AuditLog` (table: `audit_log`)
23 |
24 | Every LLM call writes an entry – since Phase 12 via `app/services/audit.py`
25 | (the LLMClient audit callback, wired at app startup): asyncpg on the
26 | RLS-bound `genbi_app` role with the tenant GUC set per row, one
27 | parameterized INSERT per call, fail-open (an audit outage never breaks the
28 | pipeline). Schema:
29 |
30 | | Column | Type | Notes |
31 | |---|---|---|
32 | | `id` | `UUID` | PK |
33 | | `session_id` | `UUID` | Indexed, not null |
34 | | `user_id` | `UUID` | Not null |
35 | | `tenant_id` | `UUID` | FK → tenants, indexed |
36 | | `input_prompt_hash` | `String(64)` | SHA-256 of prompt (not raw text) |
37 | | `generated_sql` | `Text` | Nullable |
38 | | `model_name` | `String(100)` | e.g. `claude-opus-4` |
39 | | `model_version` | `String(50)` | Model version string |
40 | | `input_tokens` | `Integer` | Default 0 |
41 | | `output_tokens` | `Integer` | Default 0 |
42 | | `latency_ms` | `Float` | Default 0.0 |
43 | | `feedback_score` | `Integer` | Nullable, filled post-hoc |
44 | | `hallucination_flag` | `Boolean` | Default False |
45 | | `created_at` | `TIMESTAMPZ` | |
46 |
47 | ### `Conversation` (table: `conversations`)
48 |
49 | | Column | Type | Notes |
50 | |---|---|---|
51 | | `id` | `UUID` | PK |
52 | | `user_id` | `UUID` | Not null |
53 | | `tenant_id` | `UUID` | FK → tenants, indexed |
54 | | `title` | `String(500)` | Nullable |
55 | | `created_at` | `TIMESTAMPZ` | |
56 | | `updated_at` | `TIMESTAMPZ` | |
57 |
58 | ---
59 |
60 | ## Database Session
61 |
62 | **File:** `backend/app/db/session.py`
63 |
64 | ```python
65 | engine = create_async_engine(
66 |     settings.DATABASE_URL,
67 |     echo=settings.DEBUG,
68 |     pool_size=20,
69 |     max_overflow=10,
70 |     pool_pre_ping=True,
71 | )
72 |
73 | async_session = async_sessionmaker(
74 |     engine,
75 |     class_=AsyncSession,
76 |     expire_on_commit=False,
77 | )
78 | ```
79 |
80 | ### `get_db()` – FastAPI Dependency
81 |
82 | ```python
83 | async def get_db() -> AsyncSession:
84 |     async with async_session() as session:
85 |         try:
86 |             yield session
87 |         except Exception:
88 |             await session.rollback()
89 |             raise
90 |         finally:
91 |             await session.commit()
92 |     ```
93 |
94 | ---
95 |
96 | ## Connectors
97 |
98 | ### `BaseConnector` (ABC)
99 |
100 | **File:** `backend/app/connectors/base.py`

```

```

101 |
102 | ```python
103 | class BaseConnector(ABC):
104 |     name: str = "base"
105 |     _read_only: bool = True      # All connectors enforce read-only
106 |
107 |     @abstractmethod
108 |     async def connect(self) -> None: ...
109 |     @abstractmethod
110 |     async def execute(self, sql: str) -> list[dict]: ...
111 |     @abstractmethod
112 |     async def get_schema(self) -> dict: ...
113 |     @abstractmethod
114 |     async def disconnect(self) -> None: ...
115 | ```
116 |
117 | Every connector is read-only by design. Writes require explicit service methods with authorization.
118 |
119 | ### `PostgreSQLConnector`
120 |
121 | **File:** `backend/app/connectors/postgresql_connector.py` | **Name:** `postgresql`
122 |
123 | **Constructor:**
124 | ```python
125 | PostgreSQLConnector(
126 |     connection_url=settings.DATABASE_URL,
127 |     schema="public",
128 |     pool_size=10,
129 |     max_overflow=5,
130 |     echo=False,
131 | )
132 | ```
133 |
134 | **`execute(sql, params=None) -> list[dict]`:**
135 | 1. Requires `_connected = True`
136 | 2. Rejects non-SELECT queries: validates SQL starts with `SELECT`, `WITH`, `EXPLAIN`, `SHOW`, or `DESCRIBE`
137 | 3. Prepends `SET LOCAL statement_timeout = '30s'; SET LOCAL default_transaction_read_only = on;`
138 | 4. Executes inside `SET TRANSACTION READ ONLY` block
139 | 5. Converts rows to dicts; types converted with `isoformat()` for JSON serialization
140 |
141 | **`get_schema() -> dict`:**
142 | Queries `information_schema.tables` + `information_schema.columns` for the configured schema. Includes table/column comments (`obj_description`, `col_
142 | description`) and approximate row counts.
143 |
144 | **`explain(sql) -> dict`:**
145 | Runs `EXPLAIN (FORMAT JSON)` and extracts `estimated_cost` and `estimated_rows`.
146 |
147 | **`get_sample_rows(table_name, schema, limit=5) -> list[dict]`:**
148 | Uses quoted identifiers for read-only sampling.
149 |
150 | ### Connector Registry
151 |
152 | **File:** `backend/app/connectors/registry.py`
153 |
154 | ```python
155 | _registry: dict[str, type[BaseConnector]] = {}
156 |
157 | def register_connector(name: str): ... # decorator
158 | def get_connector(name: str) -> type[BaseConnector] | None: ...
159 | def list_connectors() -> list[str]: ...
160 | ```
161 |
162 | ---
163 |
164 | ## Schema Retrieval (NL2SQL grounding, Phase 11)
165 |
166 | **File:** `backend/app/services/schema_retrieval.py` | **Provider:** `backend/app/core/embeddings.py`
167 |
168 | The user's query is embedded (OpenAI `text-embedding-3-small`, 1536 dims -
169 | matching the `VECTOR(1536)` columns) and matched against the tenant-scoped
170 | `schema_embeddings` (top-k tables) and `agent_examples` (top-k validated
171 | NL/SQL pairs) tables via cosine distance (`<=>`). Reads run through
172 | `PostgreSQLConnector` as the RLS-bound `genbi_app` role with the tenant GUC
173 | set, so retrieval is tenant-isolated at the database layer.
174 |
175 | Wired in `ChatService._step_nl2sql` with the two-tier cache
176 | (`schema:{query_hash}` TTL 86400s, `fewshot:{query_hash}` TTL 3600s) and
177 | everything fails open - no key / no embeddings / DB down -> empty context.
178 | Populate with `PYTHONPATH=backend uv run python scripts/embed_schema.py
179 | --examples` (embeds all tables + the 20 golden NL/SQL pairs; needs
180 | `OPENAI_API_KEY`; invalidates the schema cache after sync).
181 |
182 | ---
183 |
184 | ## Apache AGE Graph Schema
185 |
186 | **File:** `backend/app/db/graph_schema.py` | **Graph name:** `genbi_graph`
187 |
188 | ### Vertex Labels
189 |
190 | | Label | Description |
191 | |---|---|
192 | | `TABLE` | Database table or Cube cube |
193 | | `COLUMN` | Table column or Cube dimension |
194 | | `METRIC` | Business metric (Cube measure) |
195 | | `DASHBOARD` | User-created dashboard |
196 | | `USER` | Platform user (for access control edges) |
197 |
198 | ### Edge Labels
199 |
200 | | Label | Direction | Description |
201 | |---|---|---|
202 | | `TABLE_CONTAINS` | TABLE -> COLUMN | Table columns |
203 | | `METRIC_SOURCE` | METRIC -> TABLE | Which table a metric derives from |
204 | | `METRIC_DEPENDS` | METRIC -> METRIC | Derived metric dependency chain |

```

```

205 | | `DASHBOARD_USES` | DASHBOARD → METRIC/TABLE | Dashboard data sources |
206 | | `USER_CAN_ACCESS` | USER → TABLE/METRIC | Row-level access control |
207 | | `TABLE_JOINS` | TABLE → TABLE | Known join paths between tables |
208
209 ### Key Functions
210
211 | Function | Purpose |
212 |---|---|
213 | `init_age_graph(db_session)` | Idempotent: creates AGE extension + graph |
214 | `ingest_table(db_session, ...)` | Creates Table + Column vertices with edges |
215 | `ingest_metric(db_session, ...)` | Creates Metric vertices linked to tables |
216 | `get_metric_lineage(db_session, metric_name)` | Full lineage path for a metric (all upstream tables) |
217 | `find_join_paths(db_session, table_a, table_b, max_depth=3)` | Used by NL2SQLAgent to discover join paths |
218 | `get_downstream_impact(db_session, table_name)` | Impact analysis – what metrics/dashboards are affected |
219 | `sync_semantic_layer_to_graph(db_session, cube_client)` | Nightly: syncs Cube cubes → AGE vertices |
220
221 ---
222
223 ## Alembic Migrations
224
225 **File:** `backend/app/db/migrations/env.py`
226
227 Standard Alembic configuration:
228 - Reads `sqlalchemy.url` from `settings.DATABASE_URL_SYNC`
229 - Uses `Base.metadata` for autogenerate support
230 - `poolclass=pool.NullPool` for migration safety
231
232 ```bash
233 # Create a new migration
234 uv run alembic revision --autogenerate -m "add new column"
235
236 # Apply migrations
237 uv run alembic upgrade head
238 ```
239
240 ---
241
242 ## Database Rules (from CLAUDE.md)
243
244 - **Every table MUST have:** `id` UUID PK DEFAULT gen_random_uuid(), `created_at`, `updated_at`, `tenant_id` FK
245 - **RLS:** every user-data table enables row-level security
246 - **No dropping columns** – mark `deprecated_at` TIMESTAMPTZ first, remove after 2 sprints
247 - **Indexes:** all FKs and `tenant_id` columns indexed
248 - **Query timeout:** 30s via `SET LOCAL statement_timeout`
249 - **Migrations:** Alembic only – no manual `ALTER TABLE`

```

1 | # Frontend Guide
2 |
3 | > Next.js 15 App Router, TypeScript 5.9, Tailwind CSS v4, shadcn/ui components.
4 |
5 | ## Tech Stack
6 |
7 | | Layer | Choice |
8 | |---|---|
9 | | Framework | Next.js 15 (App Router) |
10 | | Language | TypeScript 5.9 (strict) |
11 | | Styling | Tailwind CSS v4 with custom `brand` palette |
12 | | Components | shadcn/ui (Radix UI primitives) |
13 | | Validation | Zod 3.24 |
14 | | Icons | lucide-react |
15 | | Markdown | react-markdown (rehype + remark plugins) |
16 |
17 | ---
18 |
19 | ## Project Structure
20 |
21 | ...
22 | frontend/src/
23 | └─ app/
24 |   │ └─ globals.css          ← Tailwind directives + brand palette
25 |   │ └─ layout.tsx          ← RootLayout (metadata, AuthProvider)
26 |   │ └─ page.tsx            ← Landing page (hero + auth-aware CTA)
27 |   │ └─ login/
28 |   │   │ └─ page.tsx        ← Login page (LoginForm → redirects to /chat)
29 |   │ └─ chat/
30 |   │   │ └─ page.tsx        ← Chat page (AuthGuard → ChatView)
31 |   │ └─ explore/
32 |   │   │ └─ page.tsx        ← Explore page (AuthGuard → ExploreView)
33 |   └─ components/
34 |     │ └─ auth/
35 |     │   │ └─ auth-provider.tsx ← AuthProvider + AuthGuard (redirects to /login)
36 |     │   │ └─ login-form.tsx    ← Email/password sign-in form
37 |     │ └─ charts/
38 |     │   │ └─ chart-card.tsx    ← ChartCard + ChartGrid
39 |     │ └─ chat/
40 |     │   │ └─ chat-view.tsx     ← Full ChatView with SSE consumption
41 |     │ └─ explore/
42 |     │   │ └─ explore-view.tsx  ← Metric catalog + native query builder
43 |     └─ ui/                    ← 11 shadcn/ui primitives
44 |   └─ lib/
45 |     │ └─ api-client.ts        ← Centralized API client with JWT + SSE
46 |     │ └─ auth-storage.ts      ← Session keys + localStorage helpers (genbi_token/genbi_user)
47 |     │ └─ shadcn.ts            ← cn() utility (clsx + twMerge)
48 |     │ └─ validators.ts        ← Zod schemas with inferred types
49 |   └─ types/
50 |     │ └─ index.ts             ← Shared types
51 |     └─ chart.ts               ← ChartAssemblyInput, enums
52 |   ...
53 |
54 | ---
55 |
56 | ## API Client
57 |
58 | **File:** `src/lib/api-client.ts`
59 |
60 | Centralized fetch wrapper. All backend communication routes through this file.
61 |
62 | ### Core Request Function
63 |
64 | ```typescript
65 | async function request<T>(path: string, options: RequestInit = {}): Promise<T>
66 | ```
67 |
68 | - Sets `Content-Type: application/json`
69 | - Attaches JWT from `auth-storage` (`genbi_token` key)
70 | - Throws `ApiError(status, code, message)` on non-OK responses
71 | - Default base URL: `http://localhost:8000/api/v1`
72 |
73 | ### `ApiError` Class
74 |
75 | ```typescript
76 | class ApiError extends Error {
77 |   status: number;
78 |   code: string;
79 |   message: string;
80 | }
81 | ```
82 |
83 | ### Exported Functions
84 |
85 | ```typescript
86 | sendChat(req: ChatRequest): Promise<ChatResponse> // POST /chat
87 | streamChat(req: ChatRequest, onEvent, onError): AbortController // POST /chat/stream (SSE)
88 | renderChart(req: ChartRenderRequest): Promise<ChartRenderResponse> // POST /charts/render
89 | listMetrics(): Promise<MetricListResponse> // GET /metrics/list (Phase 10)
90 | queryMetrics(req: MetricQueryRequest): Promise<MetricQueryResponse> // POST /metrics/query (tenant-scoped)
91 | listDatasources(): Promise<{ datasources: DatasourceSummary[]; count: number }> // GET /datasources
92 | healthCheck(): Promise<{ status: string; version: string }> // GET /health
93 | ```
94 |
95 | ### `streamChat` - SSE Implementation
96 |
97 | Uses `ReadableStream` reader with a line buffer:
98 | - Splits on `\n`
99 | - Strips `data:` prefix
100 | - Parses JSON via `JSON.parse`

```

```

101 | - Calls `onEvent(parsed)` for each event
102 | - Invalid lines are silently skipped
103 | - Returns `AbortController` for cancellation
104 |
105 | ---
106 |
107 | ## Zod Validators
108 |
109 | **File:** `src/lib/validators.ts`
110 |
111 | All schemas use `z.object(...)` with inferred types:
112 |
113 | | Schema | Key Validations |
114 | |---|---|
115 | | `ChatRequestSchema` | `query: z.string().min(1).max(2000)`, optional `conversation_id: z.string().uuid()` |
116 | | `ChatResponseSchema` | All optional except `conversation_id`, `query`, `warnings` |
117 | | `SSEEventSchema` | `event: z.enum(["start","intent","sql","validation","data","chart","narrative","done"])` |
118 | | `ChartAssemblyInputSchema` | `chartType: z.string().min(1)`, `encodings`, `baseSize` (positive ints) |
119 | | `MetricDefinitionSchema` | `metric_type: z.enum([...9 types])` |
120 | | `LoginRequestSchema` | `email: z.string().email()`, `password: z.string().min(6)` |
121 | | `LoginResponseSchema` | `access_token`, `token_type`, `user: { id, email, name, tenant_id, roles }` |
122 |
123 | ---
124 |
125 | ## Chat View (SSE Streaming)
126 |
127 | **File:** `src/components/chat/chat-view.tsx`
128 |
129 | The main application component. Full-height flex layout with:
130 |
131 | ### State
132 | ```typescript
133 | messages: ChatMessage[]; // User + assistant message pairs
134 | loading: boolean; // In-flight request indicator
135 | abortRef: AbortController; // SSE cancellation
136 | ```
137 |
138 | ### Pipeline Progress (Stage Badges)
139 |
140 | A row of `Badge` components shows real-time pipeline progress: `Intent` → `SQL` → `Validated` → `Results` → `Chart` → `Insight` → `Done`
140 | . A pulsing badge appears while the corresponding stage is streaming.
141 |
142 | ### SSE Event Handling
143 |
144 | `updateMessageStage(msg, event)` incrementally populates the assistant message:
145 |
146 | | Event | Populates |
147 | |---|---|
148 | | `sql` | `msg.sql` |
149 | | `validation` | `msg.sql` = `validated_sql` |
150 | | `data` | Row count, data preview |
151 | | `chart` | `msg.chartSpec`, `msg.chartSvg`, `msg.chartBase64` |
152 | | `narrative` | `msg.narrative` |
153 | | `done` | Finalizes content, sets `streaming: false` |
154 |
155 | ### Layout
156 |
157 | - **Header:** Logo, view toggle ("Chat" / "Metrics"), settings, user avatar, logout
158 | - **Messages area:** Scrolling container. Empty state: centered greeting with three suggestion chips ("Show revenue by region", "Monthly active users trend", "Top 10 customers by value"). User messages: right-aligned, `brand-600` background. Assistant messages: `Card` with stage badges, SQL block (dark terminal style with copy button), chart card, narrative text, amber warning boxes.
159 | - **Input bar:** Fixed-bottom styled `Input` with Send/Cancel button. Disclaimer: "GenBI can make mistakes. Verify important data."
160 |
161 | ---
162 |
163 | ## Chart Card
164 |
165 | **File:** `src/components/charts/chart-card.tsx`
166 |
167 | **Props:** `spec: ChartAssemblyInput`, `imageBase64?: string`, `svg?: string`, `title?: string`, `onDownload?: () => void`
168 |
169 | Renders within a bordered `Card`:
170 | - **Header:** chart type label + "Flint" badge, format toggle (SVG/PNG), Download button
171 | - **Body:** Conditionally renders:
172 |   - SVG via `dangerouslySetInnerHTML` with `class="vis-flint-chart"`
173 |   - Base64 PNG `` element
174 |   - Placeholder "Chart rendering..." while streaming
175 |
176 | **`ChartGrid`:** Responsive 1-column (mobile) / 2-column (desktop) grid layout for multiple charts.
177 |
178 | ---
179 |
180 | ## Auth Provider
181 |
182 | **File:** `src/components/auth/auth-provider.tsx`
183 |
184 | ### Auth Flow
185 |
186 | ```typescript
187 | interface AuthState {
188 |   user: User | null;
189 |   token: string | null;
190 |   loading: boolean;
191 |   login(email: string, password: string): Promise<void>;
192 |   logout(): void;
193 |   isAuthenticated: boolean;
194 | }
195 | ```
196 |
197 | - **Login:** POST to `/auth/login`, stores `genbi_token` + `genbi_user` in `localStorage` (via `lib/auth-storage.ts`)
198 | - **Session restoration:** On mount, reads from `localStorage`. If parsing fails, clears both.
199 | - **Loading guard:** While `loading` is true, renders nothing (or bouncing dots in `AuthGuard`).
200 |
201 | ### `AuthGuard` Component
202 |

```

```

203 | Wraps protected pages. Shows:
204 | - Loading: bouncing dots animation
205 | - Unauthenticated: `router.replace("/login")` redirect
206 | - Authenticated: children
207 |
208 | ### `LoginForm` Component
209 |
210 | **File:** `src/components/auth/login-form.tsx` - extracted, reusable email/password form with `onSuccess` callback. Used by the `/login` page, which n
211 | avigates to `/chat` after a successful sign-in.
212 | ---
213 |
214 | ## UI Components (shadcn/ui)
215 |
216 | **File:** `src/components/ui/*.tsx` | **Utility:** `cn()` from `@/lib/shadcn`
217 |
218 | All 11 components use Radix UI primitives and Tailwind CSS with class-variance-authority (CVA) for variants.
219 |
220 | | Component | Primitive | Variants / Notes |
221 | |---|---|---|
222 | | `Avatar` | `@radix-ui/react-avatar` | Root (40x40, rounded-full), Image, Fallback (gray bg, centered initials) |
223 | | `Badge` | Plain div | `default` (brand), `secondary`, `destructive`, `outline`, `success`, `warning`. Pill shape, text-xs |
224 | | `Button` | `@radix-ui/react-slot` (asChild) | `default` (brand+shadow), `destructive`, `outline`, `secondary`, `ghost`, `link`. Sizes: `default`, `s
225 | m`, `lg`, `icon` |
226 | | `Card` | Plain HTML | Compound: Card, CardHeader, CardTitle, CardDescription, CardContent, CardFooter. Rounded-xl border shadow |
227 | | `Dialog` | `@radix-ui/react-dialog` | Overlay (bg-black/50), Content (centered, rounded-xl), with X close button |
228 | | `DropdownMenu` | `@radix-ui/react-dropdown-menu` | Content (z-50, min-w-8rem), Items with keyboard shortcuts, Separator |
229 | | `Input` | Plain `<input>` | h-10, rounded-lg border, focus ring-brand-600 |
230 | | `Separator` | Plain div | Horizontal (`h-px w-full`) or Vertical |
231 | | `Skeleton` | Plain div | `animate-pulse rounded-md bg-gray-200` |
232 | | `Tabs` | `@radix-ui/react-tabs` | List (inline-flex, bg-gray-100), Trigger (pill, active-white bg+shadow), Content |
233 | | `Tooltip` | `@radix-ui/react-tooltip` | Content (bg-gray-900, text-xs, white text, shadow-md) |
234 |
235 | ### shadcn.cn Utility
236 |
237 | ```typescript
238 | import { clsx, type ClassValue } from "clsx";
239 | import { twMerge } from "tailwind-merge";
240 | export function cn(...inputs: ClassValue[]) { return twMerge(clsx(inputs)); }
241 | ```
242 | ---
243 |
244 | ## Type Definitions
245 |
246 | **File:** `src/types/chart.ts`
247 |
248 | ```typescript
249 | export interface ChartAssemblyInput {
250 |   chartType: string;
251 |   encodings: Record<string, { field: string }>;
252 |   baseSize: { width: number; height: number };
253 |   semantic_types?: Record<string, "Category" | "Quantity" | "Temporal">;
254 |   data: { values?: Record<string, unknown>[]; url?: string };
255 | }
256 |
257 | export type ChartBackend = "vegalite" | "echarts" | "chartjs";
258 | export type ChartOutputFormat = "png" | "svg";
259 | ```
260 | ---
261 |
262 | ## Pages
263 |
264 | ### `layout.tsx` - Root Layout
265 |
266 | - HTML metadata: title `GenBI - Generative Business Intelligence`
267 | - Applies `globals.css`, wraps children in `AuthProvider`
268 | - Body: `min-h-screen bg-gray-50 text-gray-900 antialiased`
269 |
270 | ### `page.tsx` - Landing Page
271 |
272 | Minimal hero (logo, tagline, CTA). The CTA routes to `/login` when signed out and `/chat` when signed in.
273 |
274 | ### `login/page.tsx` - Login Page
275 |
276 | Redirects to `/chat` if already authenticated; otherwise renders `LoginForm`, which navigates to `/chat` on success.
277 |
278 | ### `chat/page.tsx` - Chat Page
279 |
280 | Wraps `ChatView` in `AuthGuard` (redirects to `/login` when signed out). The header's database icon navigates to `/explore`; the file icon to `/report
281 | s`.
282 |
283 | ### `explore/page.tsx` - Explore Page (Phase 10)
284 |
285 | Wraps `ExploreView` (`components/explore/explore-view.tsx`) in `AuthGuard`. The semantic-layer workbench:
286 |
287 | - **Catalog**: metrics from `GET /metrics/list` as clickable cards (title, cube, `metric_type` badge); selecting one sets the query's measure.
288 | - **Query builder**: native `<select>` elements (no new deps) for measure, group-by dimension (from the measure's dimensions), optional time granulari
289 | ty (day/month via its first time dimension), and row limit.
290 | - **Run**: `POST /metrics/query` → results table (hand-built Tailwind `<table>`, cube-prefix-stripped keys) +, when sliced by a dimension, a bar chart
291 | : the client builds a `ChartAssemblyInput` from the result rows, renders via `POST /charts/render`, and displays through the existing `ChartCard`.
292 | - Empty results show an RLS-aware hint (tenant has no data - `make seed`).
293 | - API functions live in `lib/api-client.ts` (`listMetrics`, `queryMetrics`, `listDatasources`); Zod schemas (`MetricQueryRequestSchema` etc.) in `lib/
294 | validators.ts`.
295 |
296 | ### `reports/page.tsx` - Reports Page (Phase 16)
297 |
298 | Wraps `ReportsView` (`components/reports/reports-view.tsx`) in `AuthGuard`. The multi-chart report workbench:
299 |
300 | - **Generator**: prompt input + section-count select (2-4) + Generate → `POST /reports/generate`.
301 | - **Sidebar**: past reports from `GET /reports` (title, section count); select loads via `GET /reports/{id}`.
302 | - **Report display**: title + overall summary + badges, per-section cards (heading with total/row count, `ChartCard` with the persisted SVG, optional
303 | narrative), warnings panel (skipped metrics, persistence notice).
304 | - API functions: `generateReport`, `listReports`, `getReport` in `lib/api-client.ts`.

```

```
301|
302| ### Configuration
303|
304| **`next.config.js`:** `output: "standalone"` (containerized deployment)
305|
306| **`tailwind.config.ts`:** Custom `brand` palette (indigo tones):
307| ```typescript
308| brand: {
309|   50: '#edf2ff', 100: '#dbe4ff', ...,
310|   600: '#4c6ef5', 700: '#4263eb', ..., 900: '#1e2a8a'
311| }
312| ```
313|
314| ---
315|
316| ## Build Commands
317|
318| ```bash
319| pnpm dev      # Next.js dev server (port 3000)
320| pnpm build    # Production build
321| pnpm start    # Start production server
322| pnpm lint     # ESLint
323| pnpm typecheck # tsc --noEmit
324| ```
```

1 | # GenBI Platform – Development Documentation
2 |
3 | > **Version:** 0.1.0 | **Stack Tier:** Enterprise | **Last updated:** 2026-08-15
4 |
5 | A **Generative BI (GenBI) platform** that enables business users to query enterprise data warehouses using natural language, auto-generates visualizat
6 | ions and narrative insights, and delivers governed, explainable analytics at scale.
7 |
8 | ## Quick Links
9 |
10 | ### Architecture & Design
11 | - [Architecture Overview](architecture-overview.md) – Four-tier architecture, data flow, technology stack
12 | - [Agent System](agent-system.md) – Multi-agent LangGraph pipeline, agent roster, LLM model usage
13 | - [Architecture Decision Records](adr/) – ADR 001-008 covering chart stack, agent topology, Flint bridge, AGE image, enforced RLS roles, Cube-native c
14 | atalog, and per-tenant Cube data path
15 |
16 | ### API
17 | - [API Reference](api-reference.md) – Complete REST API documentation, request/response schemas, SSE streaming
18 |
19 | ### Backend Services
20 | - [Core Services](core-services.md) – Configuration, logging, LLM client, caching, auth, PII masking, observability
21 | - [Data Layer](data-layer.md) – Database models, connectors (read-only), Apache AGE graph schema, migrations
22 | - [Semantic Layer](semantic-layer.md) – Cube-native metric catalog → Cube.dev API → Python CubeClient
23 |
24 | ### Frontend
25 | - [Frontend Guide](frontend-guide.md) – Next.js 15 App Router, shadcn/ui components, SSE chat, Explore metric workbench, Zod validators
26 |
27 | ### Operations
28 | - [Infrastructure](infrastructure.md) – Docker Compose (dev + prod), CI/CD, environment variables, scripts
29 |
30 | ### Key Concepts
31 |
32 | | Concept | Where |
33 | |---|---|
34 | | NL → SQL → Chart → Narrative pipeline | [Agent System](agent-system.md#pipeline-data-flow) |
35 | | Dual chart stack (Flint MCP + AntV G2) | [ADR 001](adr/001-dual-chart-stack.md) |
36 | | Schema embedding + pgvector semantic search | [Semantic Layer](semantic-layer.md) |
37 | | Read-only SQL enforcement (Safety Gate) | [Agent System](agent-system.md#32-validationagent) |
38 | | Dual-tier cache (L1 LRU + L2 Redis) | [Core Services](core-services.md#4-cache-service) |
39 | | Multi-tenant JWT + RLS isolation | [Core Services](core-services.md#5-authentication) |
40 | | SSE streaming from agent pipeline to chat UI | [API Reference](api-reference.md#streaming) |
41 | | Chart hallucination detection + auto-correction | [Agent System](agent-system.md#35-chart-validator) |
42 |
43 | ### Tech Stack at a Glance
44 | ```
45 | Backend:      Python 3.12 · FastAPI · Uvicorn / Gunicorn
46 | LLM Layer:    Anthropic Claude (Opus for SQL, Haiku for speed)
47 |               LangChain / LangGraph orchestration
48 |               LlamaIndex for semantic indexing / RAG
49 | Databases:    PostgreSQL 16 · pgvector (embeddings) · Apache AGE (graph lineage)
50 |               Redis (query cache, session state)
51 | Frontend:     Next.js 15 · TypeScript 5.9 · Tailwind CSS v4 · shadcn/ui
52 | Charts:       Flint MCP (static) + AntV G2 (interactive) · Vega-Lite / Altair fallback
53 | Observability: OpenTelemetry · Langfuse · Prometheus + Grafana
54 | CI/CD:        GitHub Actions · Docker + Docker Compose
55 | ```

1 | # Infrastructure
2 |
3 | > Docker Compose, CI/CD, environment variables, and utility scripts.
4 |
5 | ---
6 |
7 | ## Docker Compose – Development
8 |
9 | **File:** `infra/docker-compose.dev.yml`
10 |
11 | | Service | Image / Build | Port | Volumes | Notes |
12 | |---|---|---|---|---|
13 | | **postgres** | `pgvector/pgvector:pg16` | `5432` | `postgres_data` (named) + `./postgres/init.sql` mount | `pg_isready` health check, 5s interval |
14 | | **redis** | `redis:7-alpine` | `6379` | None | `redis-cli ping` health check, 5s interval |
15 | | **backend** | Build from `../backend` | `8000` | `../backend:/app` + `flint_data:/tmp/genbi-charts` | Depends on healthy postgres + redis. `uvicorn`
16 | | --reload | hot-reload |
17 | | **frontend** | Build from `../frontend` | `3000` | `../frontend:/app`, `/app/node_modules` (anonymous) | Depends on backend. `pnpm dev` |
18 | | **cube** | `cubejs/cube:latest` | `4000` | None | Cube.dev semantic API |
19 | | **prometheus** | `prom/prometheus:latest` | `9090` | `./prometheus/prometheus.yml` mount | |
20 | | **grafana** | `grafana/grafana:latest` | `3001` | None | Depends on prometheus |
21 | | **otel_collector** | `otel/opentelemetry-collector-contrib:latest` | `4318` (HTTP), `8888` (metrics) | None | |
22 |
23 | ### Key differences from production:
24 | - Hot-reload: `uvicorn --reload` (backend), `pnpm dev` (frontend)
25 | - Volume mounts for live code editing
26 | - Health check dependencies between services
27 | - Additional observability services (Prometheus, Grafana, OTel Collector)
28 |
29 | ---
30 |
31 | ## Docker Compose – Production
32 |
33 | **File:** `infra/docker-compose.yml`
34 |
35 | | Service | Image / Build | Port | Volumes | Restart |
36 | |---|---|---|---|---|
37 | | **postgres** | `pgvector/pgvector:pg16` | `5432` | `postgres_data` + `init.sql` | `unless-stopped` |
38 | | **redis** | `redis:7-alpine` | `6379` | None | `unless-stopped` |
39 | | **backend** | Build from `../backend` | `8000` | None | `unless-stopped` |
40 | | **frontend** | Build from `../frontend` (target: `production`) | `3000` | None | `unless-stopped` |
41 |
42 | - Backend CMD: `gunicorn` with 4 `uvicorn` workers
43 | - Frontend env: `NEXT_PUBLIC_API_URL` defaults to `http://localhost:8000/api/v1`
44 | - Credentials from `../backend/.env`
45 |
46 | ### Start Commands
47 |
48 | ```bash
49 | # Development
50 | docker compose -f infra/docker-compose.dev.yml up -d
51 |
52 | # Production
53 | docker compose -f infra/docker-compose.yml up -d
54 |
55 | # Tear down (keep volumes)
56 | docker compose down
57 |
58 | # Tear down (remove volumes)
59 | docker compose down -v
60 |
61 | # Tail logs
62 | docker compose logs -f backend
63 | ```
64 |
65 | ---
66 |
67 | ## PostgreSQL Initialization
68 |
69 | **File:** `infra/postgres/init.sql`
70 |
71 | ### Extensions
72 | - `pgcrypto` – UUID generation (`gen_random_uuid()`)
73 | - `vector` – pgvector for embedding storage (1536-dim)
74 | - `age` – Apache AGE for graph queries (lineage, impact analysis)
75 |
76 | ### Schema Tables
77 |
78 | | Table | Purpose | Key columns |
79 | |---|---|---|
80 | | `tenants` | Multi-tenant root | `id` UUID PK, `name` VARCHAR(255) UNIQUE, `created_at`, `updated_at` |
81 | | `users` | Per-tenant users | `id` UUID PK, `tenant_id` FK, `email` UNIQUE, `hashed_password`, `roles` JSONB |
82 | | `audit_log` | NL2SQL audit trail | `session_id`, `user_id`, `tenant_id`, `input_prompt_hash`, `generated_sql`, `model_name`, `token_count`, `latency` ms |
83 | | `conversations` | Chat sessions | `id` UUID PK, `user_id`, `tenant_id`, `title` |
84 | | `schema_embeddings` | Vector store | `table_schema`, `table_name`, `embedding` VECTOR(1536), `description` |
85 | | `agent_examples` | Few-shot storage | `agent_name`, `input_text`, `output_json`, `embedding` VECTOR(1536) |
86 |
87 | ### Indexes
88 | - `schema_embeddings` table: IVFFlat index on `vector_cosine_ops` for semantic similarity search
89 | - `audit_log`: indexed by `session_id`, `tenant_id`, `created_at`
90 | - `agent_examples`: indexed by `agent_name` + IVFFlat
91 | - All FKs and `tenant_id` columns indexed
92 |
93 | ---
94 |
95 | ## Prometheus Configuration
96 |
97 | **File:** `infra/prometheus/prometheus.yml`
98 |
99 | ```yaml

```

```

99 | global:
100 |     scrape_interval: 15s
101 |
102 | scrape_configs:
103 |     - job_name: "genbi-backend"
104 |       static_configs:
105 |         - targets: ["backend:8000"]
106 |     - job_name: "prometheus"
107 |       static_configs:
108 |         - targets: ["localhost:9090"]
109 |     ...
110 |
111 | ---
112 |
113 | ## CI/CD Pipeline
114 |
115 | **File:** `.github/workflows/ci.yml`
116 |
117 | **Triggers:** Push to `main`/`develop`, PR to `main`
118 |
119 | ### Jobs
120 |
121 | #### 1. Backend – Lint & Test (parallel with frontend)
122 | - Python 3.12, `uv`
123 | - PostgreSQL + Redis service containers
124 | - Steps: checkout → `uv sync --frozen` → ruff lint + format check → alembic migrations check → pytest (non-e2e, with coverage) → golden NL2SQL eval →
124 | upload coverage to Codecov
125 |
126 | #### 2. Frontend – Lint & Build (parallel with backend)
127 | - Node 20, `pnpm` 9
128 | - Steps: checkout → `pnpm install` → `tsc --noEmit` → lint → build
129 |
130 | #### 3. Docker – Build Images (sequential, only on push to main/develop)
131 | - Docker Buildx, GHCR login
132 | - Build + push backend and frontend images tagged `:sha` and `:latest`
133 | - GitHub Actions cache for Docker layers
134 |
135 | #### 4. Golden Eval Gate (on main branch only)
136 | - PostgreSQL service container
137 | - Runs golden NL2SQL eval suite
138 | - Blocks merges below **90% accuracy threshold**
139 |
140 | ---
141 |
142 | ## Environment Variables
143 |
144 | **File:** `.env.example`
145 |
146 | | Category | Variable | Default |
147 | |---|---|---|
148 | | **LLM** | `ANTHROPIC_API_KEY` | (required) |
149 | | | `LLM_REASONING_MODEL` | `claude-opus-4` |
150 | | | `LLM_FAST_MODEL` | `claude-haiku-4` |
151 | | **Database** | `DATABASE_URL` | `postgresql+asyncpg://genbi_app:genbi_app@localhost:5432/genbi` (RLS-bound runtime role) |
152 | | | `DATABASE_URL_AUTH` | (optional) `postgresql+asyncpg://genbi_auth:genbi_auth@...` – login-only role; derived from `DATABASE_URL` if unset |
153 | | | `DATABASE_URL_SYNC` | `postgresql://genbi:genbi@localhost:5432/genbi` (owner – Alembic + admin scripts only) |
154 | | **Redis** | `REDIS_URL` | `redis://localhost:6379/0` |
155 | | **Semantic** | `CUBE_API_URL` | `http://localhost:4000/cubejs-api/v1` |
156 | | | `CUBE_API_SECRET` | (required) |
157 | | **Observability** | `LANGFUSE_SECRET_KEY` | |
158 | | | `LANGFUSE_PUBLIC_KEY` | |
159 | | | `LANGFUSE_HOST` | `https://cloud.langfuse.com` |
160 | | | `OTEL_EXPORTER_OTLP_ENDPOINT` | |
161 | | **Auth** | `JWT_SECRET_KEY` | `change-me` (override in production!) |
162 | | | `JWT_ALGORITHM` | `HS256` |
163 | | | `JWT_EXPIRE_MINUTES` | `60` |
164 | | **Tenant** | `TENANT_ENCRYPTION_KEY` | |
165 | | **Flint** | `FLINT_MCP_BACKENDS` | `vegalite,echarts,chartjs` |
166 | | | `FLINT_MCP_DATA_ROOTS` | `/tmp/genbi-charts` |
167 | | **App** | `APP_ENV` | `development` |
168 | | | `DEBUG` | `True` |
169 | | | `LOG_LEVEL` | `DEBUG` |
170 | | | `CORS_ORIGINS` | `["http://localhost:3000"]` |
171 |
172 | ---
173 |
174 | ## Dockerfiles
175 |
176 | ### Backend (`backend/Dockerfile`)
177 | ``dockerfile
178 | FROM python:3.12-slim
179 | COPY --from=ghcr.io/astrol-sh/uv:latest /usr/local/bin/uv
180 | # Install deps, copy code, expose 8000
181 | CMD ["uvicorn", "app.main:app", "--host", "0.0.0.0", "--port", "8000"]
182 | ...
183 |
184 | ### Frontend (`frontend/Dockerfile`)
185 | Three-stage build:
186 | 1. **deps** (`node:22-alpine`) – `pnpm install`
187 | 2. **builder** – `pnpm build`
188 | 3. **production** – copy `.next/standalone` + `.next/static` + `public`, expose 3000, run `node server.js`
189 |
190 | ---
191 |
192 | ## Utility Scripts
193 |
194 | ### `scripts/embed_schema.py`
195 | Nightly schema embedding sync for pgvector semantic search.
196 |
197 | ```bash
198 | uv run python scripts/embed_schema.py --schema public # Full sync
199 | uv run python scripts/embed_schema.py --domain revenue --dry-run # Preview only
200 | ```
201 |
202 | - Queries `information_schema` + `pg_catalog.pg_description`

```

```

203 | - Generates 1536-dim embeddings via `claude-embeddings-20250219`
204 | - Upserts into `schema_embeddings` table
205 | - Returns `{tables_processed, embeddings_generated, errors}`
206 |
207 | ### `scripts/seed_test_data.py`
208 | Synthetic test data generator for development.
209 |
210 | ```bash
211 | uv run python scripts/seed_test_data.py          # Default (1 tenant)
212 | uv run python scripts/seed_test_data.py --tenants 3 --clear    # 3 tenants, fresh start
213 | ```
214 |
215 | Generates realistic data for 10 tables:
216 | `sales`, `customers`, `orders`, `transactions`, `users`, `products`, `regions`, `sales_representatives`, `deals`, `activity`
217 |
218 | Each table has a dedicated generator function (realistic company names, product names, dates). Batch inserts in chunks of 100 with `ON CONFLICT DO NOT
218 | HING`.
219 |
220 | ---
221 |
222 | ## Key Commands
223 |
224 | ```bash
225 | # Backend
226 | cd backend
227 | uv run uvicorn app.main:app --reload --port 8000    # Dev server
228 | uv run pytest tests/ -v --tb=short                  # Fast tests (skip e2e)

1 | # Semantic Layer
2 |
3 | > Single source of truth for business metric definitions:
4 | > **Cube-native data models** (`semantic/cube/model/`) served by **Cube.dev**,
5 | > consumed by the Python **CubeClient**. See
6 | > [ADR 007](adr/007-cube-native-semantic-layer.md) for why the dbt tier was
7 | > dropped.
8 |
9 | ## Architecture
10 |
11 | ```
12 | semantic/cube/model/*.yaml (10 cubes, 23 measures – the catalog)
13 | |
14 | | v
15 | | Cube.dev (cube.js, CUBEJS_DB_* env, cube_reader role)
16 | | | REST API: /meta (definitions), /load (data – Phase 10)
17 | | | v
18 | | | CubeClient (backend/app/semantic/cube_client.py, JWT-authenticated)
19 | | | | /meta → MetricDefinition map → LLM context formatting
20 | | | v
21 | | | ChatService → NL2SQLAgent prompt ("## Available Metrics") + /api/v1/metrics/list
22 | | | ```
23 |
24 | ## The Catalog
25 |
26 | **Location:** `semantic/cube/model/` – one YAML per cube, over the ten
27 | seeded analytics tables. Highlights:
28 |
29 | | Cube | Measures | Dimensions (non-time) |
30 | |---|---|---|
31 | | Sales | `revenue_total` (USD), `units_sold`, `avg_revenue_per_sale`, `sale_count` | region, product_name |
32 | | Orders | `order_count`, `order_value` (USD), `avg_order_value` | status |
33 | | Customers | `customer_count`, `active_customers` (status filter) | country, status |
34 | | Transactions | `transaction_volume` (USD), `transaction_count`, `avg_transaction` | type, status |
35 | | WebUsers | `user_count`, `active_users` | country, status |
36 | | Activity | `event_count`, `unique_active_users` (countDistinct) | event_type |
37 | | Deals | `pipeline_value` (USD), `deal_count`, `won_deals`, `win_rate` (calculated, %) | stage |
38 | | SalesReps | `rep_count` | name |
39 | | Products | `product_count`, `avg_price` | product_name, category |
40 | | Regions | `region_count` | region_name |
41 |
42 | Rules enforced by `backend/tests/semantic/test_catalog.py`:
43 |
44 | - unique cube names and measure names across the catalog
45 | - joins reference existing cubes and are **symmetric** (both sides declared)
46 | - every cube carries a `tenant_id` dimension (hidden; Phase-10 queryRewrite hook)
47 | - every measure has a `type` or a `sql` expression
48 | - the core metrics (revenue, orders, active users, pipeline, win rate...) exist
49 |
50 | **Joins follow real seed foreign keys only:** Orders↔Customers,
51 | Deals↔SalesReps↔Regions, Activity↔WebUsers. `sales.product_id`/`rep_id` are
52 | dangling in the seed data, so Sales declares no joins.
53 |
54 | ## Cube Runtime
55 |
56 | - **Config:** `semantic/cube/cube.js` – API secret + dev mode from env.
57 | - **Database:** standard `CUBEJS_DB_HOST/PORT/NAME/USER/PASS` env; Cube
58 | connects as the read-only `cube_reader` role (created by
59 | `infra/postgres/init.sql`).
60 | - **Dev compose:** the `cube` service mounts `semantic/cube` at `/cube/conf`
61 | and healthchecks via `node -e fetch(...)`.
62 | - **Secrets:** `scripts/gen-env.sh` writes `semantic/cube/.env`, keeping
63 | `CUBEJS_API_SECRET` aligned with the backend's `CUBE_API_SECRET`.
64 |
65 | ### RLS interaction (important)
66 |
67 | Analytics tables are FORCE-RLS tenant-scoped (Phase 8b / ADR 006), and data
68 | queries are tenant-correct since Phase 10 (ADR 008): the backend mints JWTs
69 | carrying a `tenantId` claim; Cube keys orchestrators (driver pools) by
70 | tenant; each pool's connections set `app.current_tenant_id` via the pg
71 | `options` parameter – the GUC the RLS policies consume. **Postgres remains
72 | the enforcement layer:** if any link is misconfigured, queries return zero
73 | rows (fail-closed), never another tenant's data. `POST /api/v1/metrics/query`
74 | and the Explore page use this path; metadata (`/meta`) needs no tenant.
75 |
76 | ## CubeClient
77 |
78 | **Location:** `backend/app/semantic/cube_client.py`
79 |
80 | - **Auth:** HS256 JWT signed with `CUBE_API_SECRET` (cached ~1h). Data
81 | queries add a `tenantId` claim – cached per tenant – which Cube surfaces
82 | as `securityContext` (ADR 008).
83 | - **`get_meta()`** fetches/parse `/meta` → `CubeMetaResponse` (cubes,
84 | metrics, raw). The **raw payload** is what gets cached (Redis + in-memory,
85 | TTL 5 min) and re-parsed on hit – serializing the parsed form loses the
86 | metrics map.
87 | - **`list_metrics()` / `get_metric(name)`** MetricDefinition lookup, indexed
88 | both as `cube.measure` and bare `measure`.
89 | - **`query(..., tenant_id=...)`: POST `/load` with measures/dimensions/timeDimensions/
90 | filters – tenant-scoped through the per-tenant driver GUC; results cached
91 | per tenant in the two-tier cache (300s).
92 | - **`get_agent_context(query=...)`: the primary agent integration point.
93 | With ≤20 metrics, formats the full catalog; above that, keyword-ranks
94 | metrics against the query (name 3x, title/cube 2x, description 1x) and
95 | injects the top 20; no keyword overlap falls back to the full list.
96 | - **`health_check()`** returns bool, never raises.
97 | - Failure semantics: callers fail open – ChatService continues without
98 | metric context when Cube is down.
99 |
100 | ### MetricDefinition

```

```

101 |
102 | ```python
103 | name          # "Sales.revenue_total"
104 | title         # "Total Revenue"
105 | description    # human + LLM readable
106 | metric_type    # MetricType (sum/count/count_distinct/avg/min/max/...)
107 | cube_name     # "Sales"
108 | measure_name  # "revenue_total"
109 | dimensions    # non-time dimension names
110 | time_dimensions # time dimension names
111 | format        # {"currency": "USD"} | {"percent": ...} | None
112 | ```
113 |
114 | ## API Surface
115 |
116 | - `GET /api/v1/metrics/list` - the catalog as JSON (JWT-authenticated;
117 |   `503 {"detail": {"code": "CUBE_UNAVAILABLE"}}` when Cube is down).
118 | - `POST /api/v1/metrics/query` - tenant-scoped metric query (ADR 008);
119 |   measures validated against the catalog (`400 INVALID_METRIC`); results
120 |   cached 300s per tenant.
121 | - `GET /api/v1/datasources` - the cubes as datasource summaries.
122 | - Frontend: the `/explore` page (catalog → query builder → table + chart).
123 |
124 | ## Key Principle
125 |
126 | Metrics are defined ONCE in `semantic/cube/model/`. Never re-implement
127 | metric logic in agent prompts or service code - always consume via
128 | CubeClient.
129 |
130 | ## Adding a Metric
131 |
132 | 1. Edit the cube YAML (or add a cube file).
133 | 2. `uv run pytest tests/semantic/test_catalog.py` - invariants must hold.
134 | 3. `make restart` - `/meta` reflects the change (5-min client cache).

1 | # PostgreSQL 16 with BOTH pgvector and Apache AGE.
2 | #
3 | # The official pgvector image ships pgvector only; Apache AGE is absent, so
4 | # `CREATE EXTENSION age` in init.sql fails on first boot. This image layers
5 | # AGE on top of pgvector so both extensions coexist (required for the
6 | # lineage graph in backend/app/db/graph_schema.py).
7 | #
8 | # Base image is Debian 12 (bookworm) – use apt-get, NOT apk (Alpine).
9 | #
10 | # Build pin: AGE is built from source against this image's PG headers. Tag
11 | # advances with AGE releases – bump together with the AGE_SUPERUSER role grant
12 | # in infra/postgres/init.sql.
13 | FROM pgvector/pgvector:pg16
14 |
15 | # Build deps for AGE, then compile AGE against the bundled PostgreSQL, then
16 | # strip the build deps to keep the image small. pg_config is at /usr/bin on
17 | # the pgvector Debian image (NOT /usr/local/bin as on Alpine variants).
18 | #
19 | # postgresql-server-dev-16 is required: the pgvector base image is a runtime
20 | # image and does not ship postgres.h / the server headers AGE compiles against.

1 | # GenBI – Generative BI Platform
2 |
3 | **Natural language → SQL → chart + narrative. Governed, explainable, multi-tenant.**
4 |
5 | GenBI lets business users query enterprise data warehouses in plain English and
6 | returns a validated SQL query, a rendered chart, and a written insight – all in
7 | a single interaction, with row-level security, PII masking, and full audit
8 | tracing enforced on every request.
9 |
10 | > **Status:** actively developed scaffold. The agent pipeline, semantic layer,
11 | > and governance controls are implemented; see [Project Status](#project-status)
12 | > for what is verified vs. in progress.
13 |
14 | ---
15 |

31 | ---
32 |
33 | ## Quick Start
34 |
35 | ### Prerequisites
36 |
37 | | Tool | Version | Why |
38 | |---|---|---|
39 | | [Docker](https://docs.docker.com/get-docker/) | + Compose v2 | latest | Runs the full stack |
40 | | [uv](https://docs.astral.sh/uv/) | latest | Python package manager (backend) |
41 | | [pnpm](https://pnpm.io/) | latest | Node package manager (frontend) |
42 | | Node.js | 22+ | Frontend runtime |
43 | | Python | 3.12+ | Backend runtime |
44 |
45 | ### One-command setup
46 |
47 | ```bash
48 | git clone <repo-url> && cd GBI
49 | make setup
50 | ```
51 |
52 | `make setup` checks prerequisites, generates `.env` files with random secrets,
53 | installs dependencies, builds Docker images, starts the stack, runs migrations,
54 | and verifies every service is healthy. On success it prints the access URLs.
55 |
56 | ### Demo credentials
57 |
58 | A dev-only user is seeded into a fresh database (via `infra/postgres/init.sql`):
59 |
60 | | Email | Password | Roles |
61 | |---|---|---|
62 | | `admin@genbi.local` | `admin123` | `admin`, `user` |
63 |
64 | > Dev-only – remove or rotate before any production deployment. Existing
65 | > databases created before this seed need `make reset` (init.sql only runs on
66 | > fresh volumes).
67 |
68 | ### Database roles (enforced tenant isolation)
69 |
70 | The backend never connects as a superuser (see
71 | [ADR 006](docs/adr/006-enforced-rls-roles.md)). Roles are created by
72 | `init.sql` on fresh volumes and by Alembic `0002_app_roles` everywhere else:
73 |
74 | | Role | Password (dev) | Used by | Can do |
75 | |---|---|---|---|
76 | | `genbi` (owner) | `genbi` | Alembic, admin scripts (`DATABASE_URL_SYNC`) | Everything |
77 | | `genbi_app` | `genbi_app` | Backend runtime + query connector (`DATABASE_URL`) | RLS-bound DML/SELECT; sees only rows matching `app.current_tenant_id` |
78 | | `genbi_auth` | `genbi_auth` | Login endpoint (`DATABASE_URL_AUTH`) | Read `users` across tenants; nothing else |
79 |
80 | All dev passwords are fixed defaults – **rotate in production**. Analytics
81 | tables (`sales`, `orders`, ..., `web_users`) are FORCE-RLS tenant-scoped like
82 | the metadata tables (Alembic `0003_analytics`).
83 |
84 | > **Upgrading an existing stack:** `make migrate` creates the roles and
85 | > analytics tables, then regenerate env files so the runtime uses the new
86 | > role URLs: `scripts/gen-env.sh --force && make restart`. Old seed data with
87 | > an analytics `users` table conflicts with `web_users` – the cleanest path
88 | > is `make reset` (fresh volume + init.sql) and re-seed.
89 |
90 | <details>
91 | <summary><b>Manual setup (if you prefer not to use the Makefile)</b></summary>
92 |
93 | ```bash
94 | # 1. Generate env files (creates backend/.env and semantic/cube/.env)
95 | scripts/gen-env.sh
96 |
97 | # 2. Install host-side dev deps
98 | cd backend && uv sync --dev && cd ..
99 | cd frontend && pnpm install && cd ..

```

```
100 |
101 | # 3. Build and start the stack
102 | docker compose -f infra/docker-compose.dev.yml up -d --build
103 |
104 | # 4. Apply migrations
105 | docker compose -f infra/docker-compose.dev.yml exec backend uv run alembic upgrade head
106 |
107 | # 5. Verify
108 | scripts/verify.sh
109 | ```
110 |
111 | </details>
112 |
113 | ### Access the platform
114 |
115 | | Service | URL | Notes |
116 | |---|---|---|
117 | | Frontend | http://localhost:3000 | Chat UI with SSE streaming |
118 | | Backend API (Swagger) | http://localhost:8000/docs | Interactive OpenAPI docs |
119 | | Health | http://localhost:8000/api/v1/health | Liveness + readiness probes |
120 | | Cube (semantic layer) | http://localhost:4000 | Metrics API |
121 | | Prometheus | http://localhost:9090 | Metrics dashboard |
122 | | Grafana | http://localhost:3001 | `admin` / `admin` |
123 |
124 | You'll need to set `ANTHROPIC_API_KEY` in `backend/.env` to enable the LLM
125 | features (NL2SQL, narrative generation).
126 |
127 | ---
128 |
129 | ## What It Does
130 |
131 | A single user query flows through a governed multi-agent pipeline:
132 |
133 | ```
134 | User Query (NL)
135 |   → RouterAgent          classify intent, build dispatch plan
136 |   → NL2SQLAgent          generate SQL with pgvector schema context + Cube metrics
137 |   → ValidationAgent      read-only + destructive-pattern safety gate
138 |   → Connector            execute (read-only, tenant-scoped, 30s timeout)
139 |   → ChartGenAgent        Flint chart spec + render + hallucination check
140 |   → NarrativeAgent        written insight paragraph
141 |   → AuditLog             persist full trace
142 | ```
143 |
144 | **Governance at every step:**
145 | - **Read-only enforcement** – `ValidationAgent` rejects any non-SELECT or
146 |   destructive SQL before execution; the connector sets
147 |   `SET TRANSACTION READ ONLY` at the DB level.
148 | - **Multi-tenant isolation** – PostgreSQL row-level security (RLS) with
149 |   `FORCE` scopes every query by `tenant_id` from the JWT.
150 | - **PII masking** – sensitive columns are masked before results reach agents
151 |   or the cache, so no PII ever enters LLM context.
152 | - **Audit trail** – every LLM call logs tokens, latency, model version, and a
153 |   prompt hash to the `audit_log` table.
154 | - **Chart hallucination detection** – a deterministic validator checks chart
155 |   specs against the underlying data and auto-corrects common errors.
156 |
157 | ---
158 |
159 | ## Architecture
160 |
161 | GenBI is built on two open-source foundations, with a semantic layer,
162 | governance controls, and a Next.js frontend layered on top.
163 |
164 | - **DB-GPT**([https://github.com/eosphoros-ai/DB-GPT]) – agentic AI data
165 |   application framework (Text2SQL, sandboxed execution, RAG).
166 | - **Flint Chart**([https://github.com/microsoft/flint-chart]) – MCP-native
167 |   chart rendering (unified spec → Vega-Lite / ECharts / Chart.js).
168 |
169 | ```
170 |
171 | | Interface      | Next.js 15 · FastAPI REST · SSE |
172 | |---|---|
173 | | Orchestration | LangGraph agents (NL2SQL, ChartGen, |
174 | |               | Narrative, Router, Validation) |
175 | |---|---|
176 | | Semantic      | Cube-native metric catalog → Cube API |
177 | |---|---|
178 | | Data          | PostgreSQL · pgvector · Apache AGE |
179 | |               | (connectors: read-only, tenant-scoped) |
180 | |---|---|
181 | | Governance    | RLS · PII masking · audit log · JWT |
182 | |---|---|
183 | ```
184 |
185 | For the full design rationale, see the
186 | [Architecture Overview](docs/architecture-overview.md) and the
187 | [Architecture Decision Records](#architecture-decision-records-adrs).
188 |
189 | ---
190 |
191 | ## Tech Stack
192 |
193 | | Layer | Technology |
194 | |---|---|
195 | | **Backend** | Python 3.12 · FastAPI · Uvicorn / Gunicorn · Pydantic v2 · SQLAlchemy 2.0 (async) |
196 | | **LLM** | Anthropic Claude (Opus for SQL reasoning, Haiku for speed) · LangChain / LangGraph · LlamaIndex |
197 | | **Semantic layer** | Cube.dev (headless BI, native data models) |
198 | | **Databases** | PostgreSQL 16 · pgvector (schema embeddings) · Apache AGE (lineage graph) · Redis (cache) |
199 | | **Frontend** | Next.js 15 (App Router) · TypeScript 5.9 · Tailwind CSS v4 · shadcn/ui · Zod |
200 | | **Charts** | Flint MCP → Vega-Lite / ECharts / Chart.js |
201 | | **Observability** | OpenTelemetry · Langfuse (LLM tracing) · Prometheus + Grafana |
202 | | **Auth** | JWT + RBAC · PostgreSQL row-level security |
203 | | **CI/CD** | GitHub Actions · Docker Compose |
204 |
```

```

205 **Package managers:** `uv` for Python (never `pip`), `pnpm` for Node (never
206 `npm`/`yarn`). See [CLAUDE.md](CLAUDE.md) $2 for the full conventions.
207
208 ---

237 |   |   ## Documentation
238 |   |   |   ### Start here
239 |   |   |   |   - **[ docs/index.md ](docs/index.md)** - curated entry point with quick links
240 |   |   |   |
241 |   |   |   |   ### Architecture & Design
242 |   |   |   |   |   - [Architecture Overview](docs/architecture-overview.md) - four-tier design, data flow, tech stack
243 |   |   |   |   |   - [Agent System](docs/agent-system.md) - multi-agent LangGraph pipeline, agent roster, safety gate
244 |   |   |   |   |   - [Core Services](docs/core-services.md) - config, LLM client, cache, auth, PII masking, observability
245 |   |   |   |   |   - [Data Layer](docs/data-layer.md) - ORM models, read-only connectors, AGE graph schema, migrations
246 |   |   |   |   |   - [Semantic Layer](docs/semantic-layer.md) - Cube-native catalog → Cube.dev → Python client
247 |   |   |   |   |   - [Frontend Guide](docs/frontend-guide.md) - Next.js App Router, shadcn/ui, SSE chat, Zod validators
248 |   |   |   |   |
249 |   |   |   |   ### API
250 |   |   |   |   |   - [API Reference](docs/api-reference.md) - REST endpoints, request/response schemas, SSE streaming
251 |   |   |   |   |   - [OpenAPI Spec](docs/api/openapi.yaml) - machine-readable API contract
252 |   |   |   |   |
253 |   |   |   |   ### Operations
254 |   |   |   |   |   - [Infrastructure](docs/infrastructure.md) - Docker Compose, CI/CD, env vars, scripts
255 |   |   |   |   |
256 |   |   |   |   ### Architecture Decision Records (ADRs)
257 |   |   |   |   |   - [ADR 001 - Dual chart stack](docs/adr/001-dual-chart-stack.md) - Flint MCP + AntV G2
258 |   |   |   |   |   - [ADR 002 - Agent architecture](docs/adr/002-agent-architecture.md) - LangGraph multi-agent topology
259 |   |   |   |   |   - [ADR 003 - vis-flint protocol](docs/adr/003-vis-flint-protocol.md) - chart embedding protocol
260 |   |   |   |   |   - [ADR 004 - Flint bridge fallback](docs/adr/004-flint-bridge-fallback.md) - render fallback path
261 |   |   |   |   |   - [ADR 005 - AGE + pgvector image](docs/adr/005-age-and-pgvector-image.md) - custom Postgres image for both extensions
262 |   |   |   |   |   - [ADR 006 - Enforced RLS roles](docs/adr/006-enforced-rls-roles.md) - non-superuser runtime roles, RLS actually enforced
263 |   |   |   |   |   - [ADR 007 - Cube-native semantic layer](docs/adr/007-cube-native-semantic-layer.md) - metric catalog as Cube data models (dbt tier dropped)
264 |   |   |   |   |   - [ADR 008 - Per-tenant Cube data path](docs/adr/008-per-tenant-cube-data-path.md) - JWT tenant claims → per-tenant driver GUC → RLS, fail-closed
265 |   |   |   |   |
266 |   |   |   |   ### AI assistant context
267 |   |   |   |   |   - [CLAUDE.md](CLAUDE.md) - full project context, hard rules, and conventions for AI coding tools
268 |   |   |   |   |
269 |   |   |   |   ---
270 |   |   |   |   ## Common Tasks
271 |   |   |   |   |
272 |   |   |   |   |   All tasks are wrapped in the [Makefile](Makefile). Run `make help` for the
273 |   |   |   |   |   full list.
274 |   |   |   |   |
275 |   |   |   |   |   | Task | Command | Notes |
276 |   |   |   |   |   |---|---|---|
277 |   |   |   |   |   | First-time setup | `make setup` | Prereqs → secrets → deps → build → migrate → verify |
278 |   |   |   |   |   | Start the stack | `make up` | Dev compose, detached |
279 |   |   |   |   |   | Stop the stack | `make down` | Keeps data volumes |
280 |   |   |   |   |   | Tail logs | `make logs` | All services, Ctrl-C to exit |
281 |   |   |   |   |   | Service status | `make ps` | Health + state |
282 |   |   |   |   |   | Smoke test | `make verify` | Health endpoints + DB + Redis + AGE |
283 |   |   |   |   |   | Apply migrations | `make migrate` | `alembic upgrade head` in backend |
284 |   |   |   |   |   | Load test data | `make seed` | Synthetic 10-table dataset |
285 |   |   |   |   |   | Regenerate secrets | `make secrets` | New random JWT / Cube / Fernet keys |
286 |   |   |   |   |   | **Nuke + restart** | `make reset` | `down -v && up` - destroys data |
287 |   |   |   |   |
288 |   |   |   |   |   ### Adding a new metric
289 |   |   |   |   |   | 1. Define it in `semantic/cube/schema/{domain}.yaml` (Cube data-model YAML).
290 |   |   |   |   |   | 2. Run `uv run pytest backend/tests/semantic/test_catalog.py` - structural invariants.
291 |   |   |   |   |   | 3. Restart Cube (`make restart`) - `/meta` reflects the change (5-min client cache).
292 |   |   |   |   |   | 4. Re-embed the schema: `uv run python scripts/embed_schema.py`.
293 |   |   |   |   |
294 |   |   |   |   |   See the [Semantic Layer docs](docs/semantic-layer.md) for details.
295 |   |   |   |   |
296 |   |   |   |   |   ### Adding a new agent
297 |   |   |   |   |   | 1. Create `backend/app/agents/{name}_agent.py` extending `BaseAgent`.
298 |   |   |   |   |   | 2. Register in `backend/app/agents/registry.py`.
299 |   |   |   |   |   | 3. Add tests in `backend/tests/agents/` with mocked LLM (`tests/fixtures/llm_mock.py`).
300 |   |   |   |   |   | 4. Update `RouterAgent`'s dispatch table.
301 |   |   |   |   |
302 |   |   |   |   |   See the [Agent System docs](docs/agent-system.md) for the full protocol.
303 |   |   |   |   |
304 |   |   |   |   |
305 |   |   |   |   |
306 |   |   |   |   |
307 |   |   |   |   |
308 |   |   |   |   |
309 |   |   |   |   |

```

```

310| ---
311|
312| ## Configuration
313|
314| All configuration is via environment variables, loaded by
315| ['backend/app/core/config.py'](backend/app/core/config.py) with Pydantic
316| Settings. Never commit '.env' files.
317|
318| | Variable | Required | Description |
319| |---|---|---|
320| | `ANTHROPIC_API_KEY` | yes | Claude API access |
321| | `DATABASE_URL` | yes | `postgresql+asyncpg://...` |
322| | `REDIS_URL` | yes | `redis://host:6379/0` |
323| | `JWT_SECRET_KEY` | yes (prod) | Random 32+ hex; **boot fails if default in non-dev** |
324| | `CUBE_API_URL` / `CUBE_API_SECRET` | yes | Cube.dev semantic layer |
325| | `TENANT_ENCRYPTION_KEY` | yes (prod) | Fernet key for tenant secrets |
326| | `LANGFUSE_*` | optional | LLM tracing (disabled if unset) |
327| | `OTEL_EXPORTER_OTLP_ENDPOINT` | optional | OTel collector |
328|
329| `scripts/gen-env.sh` (via `make setup` / `make secrets`) generates
330| `backend/.env` and `semantic/cube/.env` from `.env.example` with random secrets.
331| See `.env.example` for the full list with defaults.
332|
333| ---
334|
335| ## Testing
336|
337| ```bash
338| # Backend unit + integration tests (mocked LLM, no live services)
339| cd backend && uv run pytest tests/ -v -m "not e2e"
340|
341| # Golden NL2SQL eval gate (20 queries, 90% accuracy threshold)
342| cd backend && uv run pytest tests/evals/ -v
343|
344| # Lint + format check
345| cd backend && uv run ruff check . && uv run ruff format --check .
346|
347| # Frontend
348| cd frontend && pnpm lint && pnpm typecheck
349| ```
350|
351| The golden NL2SQL suite is a **merge gate**: 20 NL/SQL pairs scored across
352| three tolerance levels (exact / fuzzy / semantic), requiring ≥90% suite
353| accuracy. The LLM transport is mocked, but the agent's prompt-building, JSON
354| parsing, and destructive-pattern detection all run for real. See
355| ['backend/tests/evals/'](backend/tests/evals/) and
356| [CLAUDE.md §9](CLAUDE.md) for the testing philosophy.
357|
358| ---
359|
360| ## Project Status
361|
362| | Area | Status | Notes |
363| |---|---|---|
364| | Agent pipeline (NL+SQL→Chart→Narrative) | Implemented | Sync + SSE streaming |
365| | Validation safety gate | Hardened | EXPLAIN-backed row estimates + >1M-row confirmation flow (Phase 13); deterministic pattern gate remains |
366| | Semantic layer (Cube-native catalog) | Implemented | 10 cubes / 23 measures; tenant-scoped /metrics/query + Explore page (ADR 007/008) |
367| | Governance: audit trail + login throttling | Implemented | Every LLM call audited (tenant-scoped, fail-open); 5 failed logins → 429; feedback API
368| | per-role query policy (Phases 12/15) |
369| | Reports (multi-chart from NL) | Implemented | LLM-planned + deterministic execution, persisted + browsable UI (Phase 16) |
370| | NL2SQL schema grounding (pgvector retrieval) | Implemented | Schema context + few-shot into every prompt (Phase 11); needs `embed_schema.py` --examples + OPENAI_API_KEY |
371| | Multi-tenant RLS + JWT | Enforced | Non-superuser runtime roles + FORCE RLS on all tenant tables, incl. analytics (ADR 006) |
372| | PII masking | Wired | Applied at the execution chokepoint |
373| | Chart hallucination detection | Implemented | 6 validation categories + auto-correct |
374| | Dual-tier cache (L1 LRU + L2 Redis) | Implemented | Schema, metrics, results, charts |
375| | Observability (OTel + Langfuse + Prometheus) | Wired | `/metrics` endpoint on backend |
376| | Frontend chat UI | Implemented | SSE streaming, stage rendering, conversation sidebar + multi-turn history (Phase 14) |
377| | Environment provisioning (`make setup`) | Implemented | One-command bootstrap |
378| | End-to-end verification | Verified | 120 tests pass, `make verify` green, CI builds + eval gate (Phases 7-12) |
379|
380| > Phase 7 (build & test verification) closed out Phases 5b/6 as VERIFIED.
381| > Phases 8-12 delivered the auth + chat vertical slice, enforced tenant
382| > isolation (non-superuser roles, ADR 006), the Cube-native metric catalog
383| > (ADR 007), tenant-scoped Metrics + Explore (ADR 008), NL2SQL schema
384| > grounding, and governance (audit trail + login throttling).
385|
386| > See ['todo.md'](todo.md) for the phase tracker (Phases 1-12) and the
387| > implementation/verification history.
388|
389| ---
390|
391| ## Contributing
392|
393| 1. Read [CLAUDE.md](CLAUDE.md) first – it codifies the hard rules (security,
394| LLM patterns, coding conventions) that every change must respect.
395| 2. Use the package managers (`uv`, `pnpm`) – never `pip` / `npm`.
396| 3. All API routes are versioned under `/api/v1/`.
397| 4. Mock the LLM in tests; never call real APIs in unit/integration tests.
398| 5. Run `make verify` before requesting review.
399|
400| ### Protected files (require security review to change)
401|
402| Per CLAUDE.md §13, these are gated:
403| - `backend/app/core/auth.py` – JWT + RBAC
404| - `backend/app/agents/validation/validation_agent.py` – SQL safety gate
405| - `backend/app/db/migrations/` – Alembic history (never edit existing files)
406| - `infra/postgres/init.sql` – DB initialization
407|
408| ---

1 | // GenBI Cube project – data models live in ./model/*.yaml (10 cubes over the
2 | // seeded analytics tables). ADR 007 documents the pivot to Cube-native
3 | // models; ADR 008 documents the per-tenant data path below.
4 | //
5 | // Tenant isolation on data queries (/load):
6 | // 1. The backend mints JWTs carrying a `tenantId` claim (Cube surfaces
7 | //    custom claims as securityContext).
8 | // 2. contextToOrchestratorId keys the orchestrator – and therefore the
9 | //    driver pool – by tenant, so tenants never share connections.
10 | // 3. driverFactory passes the pg `options` connection parameter setting
11 | //    app.current_tenant_id – the exact GUC the Postgres RLS policies
12 | //    consume (Phase 8b).
13 | //
14 | // Failure mode is CLOSED: if the GUC is ever missing, RLS returns zero rows
15 | // for that query – it can never return another tenant's data. Metadata
16 | // requests (/meta, no tenant claim) use the plain driver.

1 | # Semantic Layer
2 |
3 | > **Source of truth: Cube-native data models** (`semantic/cube/model/*.yaml`).
4 | > See [ADR 007](../docs/adr/007-cube-native-semantic-layer.md) for why the
5 | > dbt MetricFlow scaffold was removed.
6 |
7 | ## What lives here
8 | ...
9 |
10 | semantic/cube/
11 | ├── cube.js           ← Cube project config (API secret, dev mode)
12 | ├── .env.example      ← CUBEJS_DB_* (cube_reader role) + API secret template
13 | └── schema/           ← THE CATALOG – one YAML per cube over the seeded
14 |                       analytics tables (10 cubes, 23 measures)
15 |     ├── sales.yaml    revenue_total, units_sold, avg_revenue_per_sale, sale_count
16 |     ├── orders.yaml   order_count, order_value, avg_order_value (joins Customers)
17 |     ├── customers.yaml customer_count, active_customers
18 |     ├── transactions.yaml transaction_volume, transaction_count, avg_transaction
19 |     ├── web_users.yaml user_count, active_users (joins Activity)
20 |     ├── activity.yaml event_count, unique_active_users (joins WebUsers)
21 |     ├── deals.yaml    pipeline_value, deal_count, won_deals, win_rate
22 |     ├── sales_reps.yaml rep_count (joins Deals, Regions)
23 |     ├── products.yaml product_count, avg_price
24 |     └── regions.yaml  region_count (joins Deals, SalesReps)
25 | ...
26 |
27 | ## Principles
28 |
29 | 1. **Metrics are defined ONCE here.** Never re-implement metric logic in
30 | agent prompts or service code – the backend consumes them via
31 | `CubeClient` (`/meta` for definitions, `/load` for data).
32 |
33 | 2. **Every cube carries `tenant_id`** as a (hidden) dimension – the hook for
34 | per-tenant query rewriting when data queries land (Phase 10).
35 |
36 | 3. **Joins follow real foreign keys only.** `sales.product_id`/`rep_id` are
37 | dangling in the seed data, so Sales deliberately declares no joins.
38 |
39 | 4. **Structural tests guard the catalog** (`backend/tests/semantic/test_catalog.py`):
40 | unique names, symmetric joins, tenant dimension, core metrics present.
41 |
42 | ## Runtime
43 |
44 | - The `cube` service (dev compose) mounts this directory at `/cube/conf`
45 | and connects to Postgres as the read-only `cube_reader` role.
46 |
47 | - `scripts/gen-env.sh` writes `semantic/cube/.env` with the compose-network
48 | host and the shared `CUBEJS_API_SECRET` (aligned with the backend).
49 |
50 | - Metric metadata (`/meta`) powers the NL2SQL agent's metric context and
51 | `GET /api/v1/metrics/list`. Data queries (`/metrics/query`) are Phase 10:
52 | analytics tables are RLS-enforced, so Cube needs per-tenant GUC driver
53 | work first (see ADR 006/007).
54 |
55 | ## Adding a metric
56 |
57 | 1. Edit the cube YAML in `schema/` (add a measure, or a new cube file for a
58 | new table).
59 |
60 | 2. Run `uv run pytest tests/semantic/test_catalog.py` – structural invariants
61 | must hold.
62 |
63 | 3. Restart the cube service (`make restart`); `/meta` reflects the change
64 | (CubeClient caches for 5 min).

1 | # GenBI Platform – Build Progress
2 |
3 | > **Last updated:** 2026-08-15 | **Stack tier:** Enterprise | **84/84 tasks complete (Phases 1-16 – full original vision shipped)**
4 |
5 | ---
6 |
7 | ## Phase 1 – Scaffolding (Tasks 1-10)
8 |
9 | | # | Task | Status |
10 | |---|---|---|
11 | | 1 | Root project configuration (CLAUDE.md, .claude/rules, .claude/skills) | |
12 | | 2 | Backend directory structure (FastAPI, agents, services, models, connectors) | |
13 | | 3 | Frontend directory structure (Next.js 15 App Router, shadcn/ui base) | |
14 | | 4 | Semantic layer structure (dbt MetricFlow + Cube.dev) | |
15 | | 5 | Infrastructure config (Docker Compose, PostgreSQL init, CI) | |
16 | | 6 | .claude/ rules and skills (api-design, llm-patterns, sql-safety) | |
17 | | 7 | Documentation (ADR records, OpenAPI specs) | |
18 | | 8 | Flint Chart integration module (ChartAssemblyInput bridge) | |
19 | | 9 | Final structure verification (85 files across 7 top-level dirs) | |
20 | | 10 | Finished Phase 1 | |
21 |
22 | ---
23 |
24 | ## Phase 2 – Core Pipeline (Tasks 11-18)
25 |
26 | | # | Task | Status |
27 | |---|---|---|
28 | | 11 | NL2SQLAgent with pgvector schema embedding retrieval | |
29 | | 12 | ValidationAgent with SQL safety gate (read-only enforcement) | |
30 | | 13 | NarrativeAgent for data storytelling and insight generation | |
31 | | 14 | Centralized LLM client with timeout, retry, and audit logging | |
32 | | 15 | PostgreSQL connector with read-only enforcement and parameterized queries | |
33 | | 16 | Cube.dev semantic layer client – async REST client with metric formatting for LLM context | |
34 | | 17 | PII masking for column-level data protection (per-tenant, role-aware) | |
35 | | 18 | End-to-end chat pipeline (NL → SQL → Chart → Narrative → AuditLog) | |
36 |
37 | ---
38 |
39 | ## Phase 3 – Infrastructure & Quality (Tasks 19-23)
40 |
41 | | # | Task | Status |
42 | |---|---|---|
43 | | 19 | Schema embedding pipeline – nightly pgvector sync from information_schema | |
44 | | 20 | Golden NL2SQL evaluation suite – 20 queries, 3 tolerance levels, 90% threshold | |
45 | | 21 | LLM mock fixtures for all agent tests | |
46 | | 22 | OpenTelemetry + Langfuse observability (7 counters/histograms, Prometheus endpoint) | |
47 | | 23 | CI/CD pipeline – GitHub Actions with lint, test, eval gate, and Docker build | |
48 |
49 | ---
50 |
51 | ## Phase 4 – Frontend & Streaming (Tasks 24-28)
52 |
53 | | # | Task | Status |
54 | |---|---|---|
55 | | 24 | Frontend app shell with Next.js App Router, shadcn/ui, and auth guard | |
56 | | 25 | Zod validation, JWT auth flow, 11 shadcn/ui components, SSE streaming chat UI | |
57 | | 26 | Apache AGE graph database – 5 vertex labels, 6 edge types, openCypher lineage and impact analysis | |
58 | | 27 | Test data infrastructure – 10 tables with synthetic generators, multi-tenant seed script | |
59 | | 28 | Progressive SSE streaming pipeline – start → intent → sql → validation → data → chart → narrative → done | |
60 |
61 | ---
62 |
63 | ## Phase 5 – Performance & Safety (Tasks 29-30)
64 |
65 | | # | Task | Status |
66 | |---|---|---|
67 | | 29 | Redis caching layer – L1 (in-memory LRU) + L2 (Redis), typed get/set for schema, metrics, results, charts, LLM responses, sessions, and rate limits | |
68 | | 30 | Chart hallucination detection – 6 validation categories (field existence, type compatibility, data ranges, null handling, structural validity) with auto-correction engine | |
69 |
70 | ---
71 |
72 | ## Integration Map
73 |
74 | ...
75 | User Query
76 |   → RouterAgent (intent classification)
77 |   → NL2SQLAgent (metric context from Cube.dev, cached at L2)
78 |   → ValidationAgent (SQL safety gate)
79 |     → Connector (read-only execution, results cached at L1+L2)
80 |       → ChartGenAgent → ChartValidator (hallucination check + auto-correct, spec cached at L2)
81 |       → NarrativeAgent (insight paragraph)
82 |       → AuditLog (persist trace)
83 | ...
84 |
85 | ## Key files delivered
86 |
87 | | File | Lines | Purpose |
88 | |---|---|---|
89 | | `backend/app/core/cache.py` | 488 | Dual-tier Redis + in-memory caching service |
90 | | `backend/app/agents/validation/chart_validator.py` | 487 | Deterministic chart hallucination detector |
91 | | `backend/app/services/chat_service.py` | 593 | Full pipeline orchestrator with caching and validation |
92 | | `backend/app/semantic/cube_client.py` | 731 | Cube.dev REST API client with metric-to-LLM formatting |
93 | | `backend/app/db/graph_schema.py` | 447 | Apache AGE lineage graph (openCypher) |
94 | | `backend/app/agents/chart_gen_agent.py` | 204 | Flint MCP chart spec generator |
95 | | `frontend/src/components/chat/chat-view.tsx` | – | Streaming chat UI with SSE consumption |
96 | | `scripts/embed_schema.py` | – | Nightly pgvector schema sync |
97 | | `scripts/seed_test_data.py` | 509 | 10-table synthetic test data generator |
98 |

```

```

99 | ---
100 |
101 | ## Phase 5b – Environment Provisioning & Bootstrap (new)
102 |
103 | > **STATUS: VERIFIED 2026-08-06.** Closed by Phase 7 Tasks 1-3. Build,
104 | > test run, and `make verify` all green; see Phase 7 for details.
105 |
106 | > **Added:** 2026-08-05. Goal: a single `make setup` (or one shell
107 | > script) takes a clean machine to a fully running platform – all services
108 | > healthy, dependencies installed, DB migrated and seeded, secrets generated,
109 | > smoke test green. Today this is impossible: the platform will not boot
110 | > end-to-end as committed. Every defect below is verified against the tree.
111 |
112 | | # | Task | Severity | Status |
113 | |---|---|---|---|
114 | | 1 | Author one-command bootstrap script (`scripts/setup.sh`) + Makefile | Blocker | |
115 | | 2 | Fix the AGE-on-pgvector image problem so `init.sql` stops failing | Blocker | |
116 | | 3 | Add the missing config/lock files the Dockerfiles require | Blocker | |
117 | | 4 | Add `alembic.ini` + first migration; reconcile the three schema sources | Blocker | |
118 | | 5 | Healthchecks + dependency ordering on every compose service | High | |
119 | | 6 | Generated `.env` files with random secrets; `make secrets` helper | High | |
120 | | 7 | Postgres role for Apache AGE + Cube dev config | Medium | |
121 | | 8 | `make verify` smoke test (health endpoints + DB round-trip) | Medium | |
122 |
123 | ---
124 |
125 | ### Task 1 – One-command bootstrap (`scripts/setup.sh` + `Makefile`)
126 |
127 | **Why it matters:** No bootstrap exists today (no `Makefile`, no `setup.sh`,
128 | no `bootstrap.*`). A new contributor must read 5 docs and still hits failures.
129 | CLAUDE.md §5 lists commands but assumes a working environment.
130 |
131 | **Deliverable – `Makefile` at repo root with these targets** (each idempotent):
132 | ```make
133 | .PHONY: setup up down logs ps verify secrets migrate seed reset clean help
134 |
135 | setup:      ## First-time: check prereqs, gen secrets, install deps, build
136 | up:         ## Start dev stack (docker compose up -d)
137 | down:       ## Stop dev stack
138 | logs:       ## Tail logs
139 | ps:         ## Show service status
140 | verify:     ## Health + smoke checks (Task 8)
141 | secrets:    ## Regenerate .env secrets
142 | migrate:    ## Run alembic upgrade head inside backend
143 | seed:       ## Load synthetic test data
144 | reset:      ## down -v && up (NUKES data)
145 | clean:      ## down -v, prune images, remove node_modules/.venv
146 | help:       ## Self-documenting target list
147 | ```
148 |
149 | **Deliverable – `scripts/setup.sh`** that `make setup` calls. Steps:
150 | 1. **Prereq check** – verify `docker`, `docker compose v2`, `uv`, `pnpm`,
151 |   `node >=22`, `python >=3.12` are installed; fail with a clear message + install
152 |   hint if any missing. Do NOT auto-install system packages (host differs).
153 | 2. **Generate `.env` files** from templates (Task 6) – `backend/.env`,
154 |   `semantic/cube/.env` – overwriting only if absent (prompt before overwrite).
155 | 3. **Install host-side dev tooling** (needed for local non-Docker dev per
156 |   CLAUDE.md §5): `cd backend && uv sync --dev`; `cd frontend && pnpm install`.
157 | 4. **Build images**: `docker compose -f infra/docker-compose.dev.yml build`.
158 | 5. **Start infra only** (`postgres redis`) and wait-healthy.
159 | 6. **Run migrations** (Task 4) + optional `make seed`.
160 | 7. **Print the access URLs**: backend `:8000/docs`, frontend `:3000`,
161 |   prometheus `:9090`, grafana `:3001`, cube `:4000`, OTLP `:4318`.
162 | 8. **Run `make verify`** at the end; exit non-zero if it fails.
163 |
164 | **Idempotency rule:** re-running `make setup` must be safe and fast – skip
165 | steps whose outputs already exist (check for `backend/.env`, `backend/.venv`,
166 | `frontend/node_modules`, built images).
167 |
168 | **Done when:** on a machine with only Docker + uv + pnpm installed,
169 | `git clone && make setup` reaches `make verify` green with no manual edits.
170 |
171 | ---
172 |
173 | ### Task 2 – Resolve AGE-on-pgvector (the platform will not init without this)
174 |
175 | **Why it matters (BLOCKER):** `init.sql:11` runs `CREATE EXTENSION age;` and
176 | `:12` runs `LOAD 'age';`, but the image is `pgvector/pgvector:pg16`
177 | (`docker-compose.dev.yml:6`, `docker-compose.yml:3`) which bundles **pgvector**,
178 | not Apache AGE**. The init script fails on first boot, the `genbi_graph` graph
179 | in `graph_schema.py:83` can't be created, and `init_age_graph()` crashes every
180 | tenant that touches lineage. This is the single most blocking provisioning
181 | defect.
182 |
183 | **Options – pick one and document the choice in a new `docs/adr/005-age-and-pgvector-image.md`:**
184 |
185 | - ***(A) Custom Postgres image with both extensions** *(recommended for dev)* –
186 |   add `infra/postgres/Dockerfile`:
187 |   ```dockerfile
188 |   FROM pgvector/pgvector:pg16
189 |   RUN apk add --no-cache --virtual .age-build build-base git clang llvm-dev \
190 |       && git clone --depth 1 https://github.com/apache/age /age \
191 |       && cd /age && make PGDIR=/usr/local/pgsql install \
192 |       && apk del .age-build
193 |   ```
194 |   Point both compose files at `build: ./infra/postgres`. Pin the AGE git ref.
195 |
196 | - ***(B) Use `apache/age:PG16` and add pgvector into it** – symmetric to (A);
197 |   AGE upstream image + pgvector build. More work; AGE's image is less maintained.
198 |
199 | - ***(C) Make AGE optional for dev** – wrap `CREATE EXTENSION age` in a guarded
200 |   block behind a `GENBI_ENABLE_AGE=true` env flag (default false in dev, true in
201 |   prod image). `graph_schema.py` already degrades; make the failure a logged
202 |   warning instead of a boot crash. This unblocks everyone immediately while (A)
203 |   is built. **Recommended as the first commit**, then layer (A) on top.

```

```

204 |
205 | **Verify:** `docker compose up postgres` exits 0 with init.sql applied;
206 | `SELECT * FROM ag_catalog.cypher('genbi_graph', $$RETURN 1$$) AS (a agtype);`
207 | returns a row.
208 |
209 | ---
210 |
211 | ### Task 3 – Add the missing files the Dockerfiles/compose require
212 |
213 | **Why it matters (BLOCKER):** the committed Dockerfiles reference files that
214 | don't exist; builds fail. Verified missing:
215 |
216 | | File | Referenced at | Effect if absent |
217 | |---|---|---|
218 | | `backend/uv.lock` | `backend/Dockerfile:9` (`COPY pyproject.toml uv.lock`) + `:10` (`uv sync --frozen`) | `--frozen` aborts: "lockfile not found".
219 | The `*` glob hides the absence at COPY time. |
220 | | `frontend/pnpm-lock.yaml` | `frontend/Dockerfile:4` (`COPY package.json pnpm-lock.yaml`) + `:5` (`pnpm install --frozen-lockfile`) | `--frozen-lock
221 | file` errors with no lockfile. |
222 | | `backend/.env` | `docker-compose.dev.yml:43` (`env_file: ../backend/.env`) | Compose **fails to start** backend ("env file not found"). |
223 | | `semantic/cube/.env` | `docker-compose.dev.yml:79` | Compose fails to start cube. |
224 | | `alembic.ini` | CI runs `uv run alembic upgrade head` (`ci.yml`) | Alembic can't locate config. (Tracked under Task 4.) |
225 |
226 | **Fix:**
227 | 1. Generate `backend/uv.lock`: `cd backend && uv lock`. Commit it. Re-running
228 | `uv sync --frozen` in the Dockerfile will then succeed.
229 | 2. Generate `frontend/pnpm-lock.yaml`: `cd frontend && pnpm install`. Commit it.
230 | 3. Don't commit `.env` files (CLAUDE.md §6 rule). Instead: `setup.sh` generates
231 | them from `.env.example` / `semantic/cube/.env.example` on first run, and
232 | `.gitignore` already excludes `*.env` (verify). Provide a checked-in
233 | `backend/.env.example` mirroring root `.env.example` if one doesn't exist.
234 |
235 | **Note on `--frozen`:** if `uv.lock`/`pnpm-lock.yaml` are absent, either drop
236 | `--frozen`/`--frozen-lockfile` for dev or (better) commit real lockfiles.
237 | Lockfiles must be committed – reproducible builds depend on it.
238 |
239 | **Done when:** `docker compose -f infra/docker-compose.dev.yml build` succeeds
240 | with no "file not found" or "lockfile missing" errors, cold.
241 |
242 | ---
243 |
244 | ### Task 4 – `alembic.ini` + first migration; kill the three-source schema drift
245 |
246 | **Why it matters (BLOCKER):** DB schema today is defined in **three places that
247 | drift:** `infra/postgres/init.sql` (Docker entrypoint), `scripts/seed_test_data.py:246-369`
248 | (hand-written DDL), and `backend/app/db/models.py` (ORM, only 3 of ~13 tables).
249 | There is **no** `alembic.ini` and `migrations/versions/` holds only `.gitkeep`
250 | – zero migrations. CI's `alembic upgrade head` is a no-op that can't locate
251 | config. `embed_schema.py:176-190` upserts into columns (`table_schema`,
252 | `full_name`, `columns_json`, `embedding_text`, `updated_at`) that don't exist in
253 | `init.sql:83-91` – the nightly sync errors against the initialized schema.
254 |
255 | **Fix:**
256 | 1. **Add `backend/alembic.ini`** with `[alembic] script_location = app/db/migrations`
257 | and `sqlalchemy.url =` empty (overridden by `migrations/env.py:18` from
258 | `settings.DATABASE_URL_SYNC`). `env.py` already exists and is correct.
259 | 2. **Generate the first migration** from the ORM as the source of truth:
260 | `cd backend && uv run alembic revision --autogenerate -m "initial schema"`.
261 | But first expand `db/models.py` to cover ALL tables in `init.sql`
262 | (`audit_log`, `conversations`, `schema_embeddings`, `agent_examples`,
263 | `tenants`, `users`) so autogenerate produces a complete baseline. Use
264 | `mapped_column` / SQLAlchemy 2.0 style per CLAUDE.md §7.
265 | 3. **Decide ownership:** `init.sql` becomes the Docker-only bootstrap
266 | (extensions + roles + the seed tenant only); Alembic owns all table DDL
267 | going forward. Move the `CREATE TABLE` block out of `init.sql` into the
268 | first migration. `seed_test_data.py` stops issuing DDL and only `INSERT`s.
269 | 4. **Fix `embed_schema.py:176-190`** to match the actual `schema_embeddings`
270 | columns (`table_name`, `column_name`, `description`, `embedding`, `tenant_id`,
271 | `created_at`) – or, better, expand the table schema to hold what the script
272 | needs and put that change in the migration.
273 | 5. Empty `migrations/script.py.mako` (0 bytes) – replace with the standard
274 | Alembic mako template so `alembic revision` works.
275 |
276 | **Done when:** `make migrate` on a fresh DB (only extensions + tenant seed
277 | applied by `init.sql`) creates every table; `init.sql` and `db/models.py` agree;
278 | `embed_schema.py` runs without `UndefinedColumn` errors.
279 |
280 | ---
281 |
282 | ### Task 5 – Healthchecks + ordering on every compose service
283 |
284 | **Why it matters:** Dev compose has healthchecks only on `postgres` and `redis`
285 | (`docker-compose.dev.yml:17-21, :29-32`). Backend depends on both via
286 | `condition: service_healthy` (:47-50) – good. But `cube`, `prometheus`,
287 | `grafana`, `otel_collector` have **no** healthcheck and no dependency edges**
288 | they race the backend on boot. **Prod compose** (`docker-compose.yml`) has
289 | **zero healthchecks anywhere** and `backend depends_on: [postgres, redis]`
290 | without `condition` (:32-34) – backend can start before Postgres accepts
291 | connections, causing boot loops on cold start.
292 |
293 | **Fix:**
294 | - Add healthchecks to `cube` (`/cubejs-api/v1/load` or a `/readyz`), `backend`
295 | (`curl http://localhost:8000/api/v1/health` – verify that route exists), and
296 | the prod `postgres`/`redis` services. Install `curl` in slim images or use
297 | `python -c "urllib.request..."` to avoid adding packages.
298 | - Convert prod `depends_on` lists to the long form with
299 | `condition: service_healthy`.
300 | - In dev, make `cube` `depends_on: postgres (healthy)` (Cube reads from PG).
301 |
302 | **Done when:** `docker compose up -d` from a clean state reaches all-green
303 | health with no restart loops; `docker compose ps` shows every service
304 | `(healthy)`.
305 |
306 | ---
307 |
308 | ### Task 6 – Generated `.env` files with random secrets + `make secrets`

```

```

307 |
308 | **Why it matters:** CLAUDE.md §6 forbids committing `.env`, but nothing
309 | generates them – compose fails (Task 3). `.env.example` has placeholder
310 | secrets (`JWT_SECRET_KEY=change-me-in-production-use-openssl-rand-64`). Without
311 | a generator, people either commit real secrets or copy placeholders verbatim
312 | (both bad). This is the provisioning-side twin of Phase 6 Task 2's fail-fast.
313 |
314 | **Deliverable – `scripts/gen-env.sh`:**
315 | - Reads root `.env.example` and writes `backend/.env`, substituting:
316 |   - `JWT_SECRET_KEY` → `openssl rand -hex 32`
317 |   - `TENANT_ENCRYPTION_KEY` → `python -c "from cryptography.fernet import Fernet; print(Fernet.generate_key().decode())"`
318 |   - `CUBE_API_SECRET` → `openssl rand -hex 32`
319 |   - `ANTHROPIC_API_KEY` → leave placeholder, warn the user to fill it
320 |   - `DATABASE_URL` → keep example value but ensure it matches the compose
321 |     `POSTGRES_USER/PASSWORD/DB`
322 | - Reads `semantic/cube/.env.example` → writes `semantic/cube/.env` with a
323 |   matching `CUBESQL_DB_HOST=postgres`, the same `CUBE_API_SECRET`, and a
324 |   generated `CUBEJS_DB_PASS` matching `POSTGRES_PASSWORD`.
325 | - Refuses to overwrite an existing `.env` unless `--force`.
326 | - `make secrets` re-runs it (alias for `scripts/gen-env.sh`).
327 |
328 | **Done when:** after `make secrets`, every `env_file:` reference in both compose
329 | files resolves; no placeholder secret remains except `ANTHROPIC_API_KEY` (which
330 | is gated behind an explicit warning).
331 |
332 | ---
333 |
334 | ### Task 7 – Postgres role for AGE + Cube dev config
335 |
336 | **Why it matters:** Apache AGE requires a superuser (or a role granted
337 | `ag_catalog`) to create/load the extension and graphs. The `genbi` role in
338 | `init.sql` is the DB owner but not a superuser, so `init_age_graph()`
339 | (`graph_schema.py:75`) will fail with permission denied at runtime even after
340 | Task 2 fixes the image. Separately, Cube needs a DB role with read access to
341 | the analytic tables; none is provisioned.
342 |
343 | **Fix (in `init.sql` post-extensions block):**
344 | ```sql
345 | -- AGE: grant the genbi role access to the graph catalog
346 | GRANT USAGE ON SCHEMA ag_catalog TO genbi;
347 | GRANT ALL ON SCHEMA ag_catalog TO genbi;
348 | -- (For dev only; in prod prefer a dedicated age_admin role.)
349 | ```
350 | - Add a read-only `cube_reader` role for Cube: `CREATE ROLE cube_reader LOGIN
351 | PASSWORD '...'; GRANT USAGE ON SCHEMA public TO cube_reader; GRANT SELECT ON
352 | ALL TABLES IN SCHEMA public TO cube_reader;` and reference it from
353 | `semantic/cube/.env`. Wire the password via `gen-env.sh` (Task 6).
354 |
355 | **Done when:** as the `genbi` role, `SELECT ag_catalog.create_graph('test');`
356 | succeeds; Cube can connect and run `/load` against a seeded table.
357 |
358 | ---
359 |
360 | ### Task 8 – `make verify` smoke test
361 |
362 | **Why it matters:** No way to confirm the stack is actually up and wired
363 | without manually hitting endpoints. Closes the provisioning loop.
364 |
365 | **Deliverable – `scripts/verify.sh`** (called by `make verify`) that checks,
366 | exiting non-zero on first failure with a readable message:
367 | 1. `GET http://localhost:8000/api/v1/health` → 200 – **CONFIRMED working**;
368 |   liveness probe returns `{"status":"ok","version":"0.1.0"}`. Route resolves
369 |   via `main.py:41` (`/api/v1`) → `router.py:9` (health, no prefix) →
370 |   `health.py:8`.
371 | 2. `GET http://localhost:8000/api/v1/health/ready` → 200 with real pings –
372 |   **REMEDIATED** (was a stub returning hardcoded `connected` for DB/Redis
373 |   even when down). Now executes `SELECT 1` on the async engine, pings Redis
374 |   via `cache.ping()` (non-memoized), returns **503** if either is unreachable,
375 |   and reports `"configured"/"unconfigured"` for Flint instead of a fake
376 |   `"connected"`. Changes in `health.py`, `cache.py` (`RedisCache.ping`).
377 | 3. `GET http://localhost:4000/cubejs-api/v1/load` → responds (Cube reachable).
378 | 4. `redis-cli -h localhost ping` → PONG.
379 | 5. `psql` into postgres → `SELECT count(*) FROM tenants;` returns ≥ 1
380 |   (seed applied); `SELECT * FROM ag_catalog.cypher('genbi_graph', $$RETURN 1$$)
381 |   AS (a agtype);` returns 1 (AGE working).
382 | 6. `curl http://localhost:3000` → 200 (frontend served).
383 | 7. Optional: `curl http://localhost:9090/-/healthy` (Prometheus).
384 |
385 | **Done when:** `make verify` prints a green checklist and exits 0 on a
386 | freshly-provisioned stack; fails loudly on any broken wire. (The health-route
387 | sub-task is already closed – see Task 8 notes in the change log.)
388 |
389 | ---
390 |
391 | ### Sequencing
392 |
393 | Tasks **2 and **3 are the unblockers – do them first (the platform won't boot
394 | without them). Then **4** (schema ownership), then **1/6/7/8** (the bootstrap
395 | glue that ties it together), then **5** (polish). Concretely:
396 |
397 | 1. Task 3 (lockfiles + .env generation) – fastest, unblocks all Docker builds.
398 | 2. Task 2 (AGE image) – unblocks DB init.
399 | 3. Task 4 (alembic + schema reconciliation) – unblocks migrations + embed pipeline.
400 | 4. Task 6 → Task 1 → Task 7 → Task 8 – the bootstrap experience.
401 | 5. Task 5 – hardening of the compose files.
402 |
403 | After Phase 5b lands, Phase 6 hardening (RLS, masking, observability wiring)
404 | can be verified against a running stack rather than by static reading.
405 |
406 | ---
407 |
408 | ## Phase 6 – Security & Integrity Hardening (post-review)
409 |
410 | > **STATUS: VERIFIED 2026-08-06.** Closed by Phase 7 Tasks 1-3. Test suite
411 | > green (57 passed), stack boots, readiness probes pass.

```

```

412 |
413 | > **Added:** 2026-08-05, following a full codebase review. Each item closes a gap
414 | > between a documented guarantee (CLAUDE.md) and the actual code. All findings
415 | > have file:line citations verified against the current tree.
416 | >
417 | > Note: original task list had 5 numbered lines; line 2 ("plumbing that fulfill
418 | > documented guarantees.") is a line-wrap continuation of line 1, so items 1+2
419 | > are merged below.
420 |
421 | | # | Task | Severity | Status |
422 | |---|---|---|---|
423 | | 1 | Wire PII masking into the pipeline + attach observability in `main.py` | High | |
424 | | 2 | Add RLS + `FORCE` to every tenant table; fail-fast on default JWT secret | High | |
425 | | 3 | Route `ChartGenAgent` through `llm_client`; dereference `settings.LLM.*_MODEL` | Medium | |
426 | | 4 | Rewrite the golden NL2SQL eval to actually invoke `NL2SQLAgent` | Medium | |
427 |
428 | ---
429 |
430 | ### Task 1 – PII masking + observability wiring (was review items #2, #6)
431 |
432 | **Why it matters:** CLAUDE.md §7 (line 207) promises "no PII ever enters LLM
433 | context", and §12 promises OpenTelemetry + Langfuse + a Prometheus `/metrics`
434 | endpoint. Neither is currently true.
435 |
436 | **Defect A – masking is dead code.** `masking.py` is fully implemented
437 | (`PIIMasker.mask_rows` at :91, `get_masker_for_tenant` at :212) but is
438 | **never imported outside its own module** (grep-confirmed). Query results flow
439 | from `PostgreSQLConnector.execute` → `ChatService.step_execute`
440 | (`chat_service.py:383`) → unmodified into `_step_chart`
441 | (`chart_gen_agent.py:91` ships `data[:10]` to the LLM) and `_step_narrative`
442 | (`chat_service.py:528` ships `data[:5]` as `data_summary["head"]`).
443 |
444 | **Fix A – single chokepoint in `_step_execute`:**
445 | - In `chat_service.step_execute`, after `results = await connector.execute(sql)`
446 |   and **before** `cache.set_query_result(...)`, apply:
447 |   ```python
448 |   from app.core.masking import get_masker_for_tenant
449 |   results = get_masker_for_tenant(self.tenant_id).mask_rows(results)
450 |   ```
451 | - Masking before caching means **cached rows are also safe** – no PII persists
452 |   in Redis/L1 either. This is the desired property for analytics.
453 | - Add a unit test in `tests/services/` feeding a row with an `email` column and
454 |   asserting the masked value reaches the chart/narrative inputs.
455 |
456 | **Defect B – observability never attached.** `observability.py` defines
457 | `init_tracing()` (:60), `init_metrics()` (:124), `instrument_app()` (:95),
458 | but `main.py` `lifespan` calls only `setup_logging()` (:16).
459 |
460 | **Fix B – wire in `main.py`:**
461 | - In `create_app()`, after `app.include_router(...)`, call `instrument_app(app)`
462 |   (must run after routes are registered).
463 | - In `lifespan` startup: `tracer_provider = init_tracing()`,
464 |   `meter_provider = init_metrics()`; on shutdown: store providers and call
465 |   `shutdown()` on each, plus `get_langfuse_tracer().flush()`.
466 | - Wrap each init in try/except so a missing collector doesn't crash boot.
467 |
468 | **Gotcha – Prometheus scrape target mismatch.** `init_metrics` uses
469 | `PrometheusMetricReader`, which serves metrics on its own port (default 9464),
470 | **not** as a FastAPI `/metrics` route. But `infra/prometheus/prometheus.yml:5-7`
471 | scrapes `backend:8000`. Either (a) add a FastAPI `/metrics` route using
472 | `prometheus_client.generate_latest`, or (b) point `prometheus.yml` at `:9464`.
473 | Pick (a) – it's the conventional shape and matches the existing "endpoint at
474 | /metrics" comment. Flag this as part of Task 1.
475 |
476 | **Done when:** a query result with a `phone` column is masked before reaching
477 | both the chart-spec prompt and the narrative prompt; `/metrics` returns the 7
478 | defined counters/histograms; OTEL spans export when `OTEL_EXPORTER_OTLP_ENDPOINT`
479 | is set.
480 |
481 | ---
482 |
483 | ### Task 2 – RLS everywhere + JWT secret fail-fast (was review items #3, #4)
484 |
485 | **Why it matters:** CLAUDE.md §8 (line 220) mandates "RLS policy must exist
486 | for every user-data table". Currently RLS is enabled on exactly **1 of 5**
487 | tenant-scoped tables. And `JWT_SECRET_KEY` defaults to "change-me"
488 | (`config.py:47`), so any deployment that forgets the env var signs tokens with
489 | a publicly known secret.
490 |
491 | **Defect A – RLS coverage.** `infra/postgres/init.sql` enables RLS only on
492 | `users` (:43). Missing: `audit_log` (:47), `conversations` (:68),
493 | `schema_embeddings` (:83), `agent_examples` (:101). `FORCE ROW LEVEL
494 | SECURITY` is never set, so even the `users` policy is bypassed by the table
495 | owner (the app's DB role).
496 |
497 | **Fix A – append to `init.sql` after the table definitions:**
498 | ```sql
499 | ALTER TABLE audit_log      ENABLE ROW LEVEL SECURITY;
500 | ALTER TABLE conversations  ENABLE ROW LEVEL SECURITY;
501 | ALTER TABLE schema_embeddings  ENABLE ROW LEVEL SECURITY;
502 | ALTER TABLE agent_examples  ENABLE ROW LEVEL SECURITY;
503 |
504 | -- Close the owner-bypass loophole on ALL tenant tables
505 | ALTER TABLE users          FORCE ROW LEVEL SECURITY;
506 | ALTER TABLE audit_log      FORCE ROW LEVEL SECURITY;
507 | ALTER TABLE conversations  FORCE ROW LEVEL SECURITY;
508 | ALTER TABLE schema_embeddings  FORCE ROW LEVEL SECURITY;
509 | ALTER TABLE agent_examples  FORCE ROW LEVEL SECURITY;
510 |
511 | CREATE POLICY tenant_isolation ON audit_log      USING (tenant_id = current_setting('app.current_tenant_id')::UUID);
512 | CREATE POLICY tenant_isolation ON conversations  USING (tenant_id = current_setting('app.current_tenant_id')::UUID);
513 | CREATE POLICY tenant_isolation ON schema_embeddings  USING (tenant_id = current_setting('app.current_tenant_id')::UUID);
514 | CREATE POLICY tenant_isolation ON agent_examples  USING (tenant_id = current_setting('app.current_tenant_id')::UUID);
515 | ```
516 |

```

```

517 | ** Gotcha 1 – nullable tenant_id.** `schema_embeddings` and `agent_examples`
518 | declare `tenant_id` UUID REFERENCES tenants(id) **without `NOT NULL`**
519 | (`init.sql:89, :108`). RLS compares `tenant_id` = `current_setting(...)`, so NULL
520 | rows are invisible to everyone – which may silently hide shared/global schema
521 | rows. Decide: either (a) `ALTER COLUMN tenant_id SET NOT NULL` (requires
522 | backfill), or (b) adjust policy to `USING (tenant_id IS NULL OR tenant_id =
523 | current_setting('app.current_tenant_id')::UUID)` if global/shared rows are
524 | intended. Resolve before applying FORCE.
525 |
526 | ** Gotcha 2 – the GUC is never set.** Even the existing `users` policy can't
527 | fire: nothing in the app calls `SET app.current_tenant_id`. The connector must
528 | issue `SET LOCAL app.current_tenant_id = '<jwt tenant_id>'` per transaction
529 | inside `execute()`/`execute_raw()` (alongside the existing `SET TRANSACTION READ
530 | ONLY`). Without this, RLS either blocks everything or (without FORCE) blocks
531 | nothing. **This is a required companion change** – wire it from the JWT
532 | `tenant_id` already extracted in `auth.py:44`.
533 |
534 | ** Gotcha 3 – protected file.** `init.sql` is in the CLAUDE.md §13
535 | DO-NOT-MODIFY list (§:302). Adding RLS *strengthens* safety rather than
536 | relaxing it, but call it out in the PR description for visibility.
537 |
538 | **Defect B – default JWT secret.** `config.py:47`.
539 |
540 | **Fix B – pydantic v2 model_validator in `Settings`:**
541 | ```python
542 | @model_validator(mode="after")
543 | def _enforce_production_secrets(self):
544 |     insecure = self.APP_ENV not in ("development", "test") and self.JWT_SECRET_KEY == "change-me"
545 |     if insecure:
546 |         raise ValueError("JWT_SECRET_KEY must be set in non-development environments")
547 |     return self
548 | ```
549 | Consider the same pattern for `ANTHROPIC_API_KEY` == "" (optional, out of scope
550 | unless desired).
551 |
552 | **Done when:** a query through the connector sets the tenant GUC and RLS
553 | enforces isolation (test: insert a row under tenant A, query as tenant B,
554 | expect 0 rows); booting with `APP_ENV=production JWT_SECRET_KEY=change-me`
555 | raises immediately.
556 |
557 | ---
558 |
559 | ### Task 3 – Route ChartGenAgent through llm_client + kill hardcoded models (was #7, #8)
560 |
561 | **Why it matters:** CLAUDE.md §6 (line 175) – **NEVER call LLM APIs without
562 | [llm_client]**; line 174 – **NEVER hardcode model names**. Both are violated.
563 |
564 | **Defect A – ChartGenAgent bypasses the wrapper.** `chart_gen_agent.py:79`
565 | constructs `ChatAnthropic(...)` directly and calls `llm.aivoke(prompt)`,
566 | skipping retry, token-budget, JSON extraction, and **audit logging**.
567 |
568 | **Fix A:** rewrite `_generate_chart_spec` to use the centralized client:
569 | ```python
570 | from app.core.llm_client import LLMCallOptions, get_llm_client
571 | client = get_llm_client()
572 | result = await client.invoke(
573 |     messages=prompt,
574 |     use_reasoning=False,
575 |     options=LLMCallOptions(temperature=0, max_tokens=2048, response_format="json"),
576 |     tenant_id=tenant_id,
577 |     user_id=user_id,
578 | )
579 | spec = result.parsed or {<existing fallback dict>}
580 | ```
581 | - Use `result.parsed` (the client already extracts JSON) instead of
582 | `json.loads(response.content)`.
583 | - **Signature change:** `_generate_chart_spec` and `execute` currently lack
584 | `user_id`. Thread `user_id` from the caller (`chat_service_step_chart`) so
585 | the audit record is attributed – `ChatService.process_query` already has it.
586 |
587 | **Defect B – hardcoded model literals in `AgentConfig`.** Literals appear at
588 | `chat_service.py:264` (`claude-haiku-4`), `:290` (`claude-opus-4`), `:417`,
589 | `:520`, and `flint_operator.py:68`. Replace each with `settings.LLM_FAST_MODEL`
590 | or `settings.LLM_REASONING_MODEL` (import `from app.core.config import settings`).
591 |
592 | **Gotcha – `AgentConfig.model_name` is decorative.** The actual model is
593 | chosen inside `llm_client.invoke` from the `use_reasoning` flag
594 | (`llm_client.py:127`), so `AgentConfig.model_name` is only a label/metadata
595 | field, never used to select the call. The fix is still correct (don't hardcode
596 | the literal), but note that swapping the string won't change which model is
597 | called unless `invoke` is also bypassed (as in Defect A). Resolving A makes B
598 | moot for correctness; B is still worth doing for grep-cleanliness.
599 |
600 | **Already correct:** `chart_gen_agent.py:81` already references
601 | `settings.LLM_FAST_MODEL` for the (soon-to-be-removed) direct call; and
602 | `narrative_agent.py` / `nl2sql_agent.py` both correctly use `get_llm_client()`.
603 | No change needed there.
604 |
605 | **Done when:** `grep -rn "claude-opus-4\|claude-haiku-4" backend/app/` returns
606 | only matches inside docstrings/comments; the chart-spec LLM call appears in the
607 | audit trail.
608 |
609 | ---
610 |
611 | ### Task 4 – Make the golden NL2SQL eval a real gate (was #14)
612 |
613 | **Why it matters:** CLAUDE.md §9 (line 242) – **Golden NL2SQL test suite must
614 | pass before any merge to main (20 queries, 90% threshold).** The threshold is
615 | currently unenforced and the test is tautological.
616 |
617 | **Defect.** `test_nl2sql_eval.py:521-558` `test_full_suite_accuracy` calls
618 | `evaluate_case(case, case.expected_sql)` – it scores each golden query's **own
619 | expected SQL** against itself and asserts `accuracy == 100.0`. It cannot detect
620 | a model regression. The machinery to do it properly exists but is unused:
621 | `MOCK_RESPONSES` (§:312), `_build_mock_responses` (§:315), and the

```

```

622 | `NL2SQLAgent` import (':26') are all built then ignored. The 90% threshold
623 | lives only in a `__main__` block (':624') that compares expected-to-expected.
624 |
625 | **Fix – instantiate the agent and mock only the LLM layer:**
626 | ```python
627 | # In TestEvalSuite.test_full_suite_accuracy:
628 | from app.core import llm_client as llm_mod
629 |
630 | class _FakeResult:
631 |     def __init__(self, payload): # payload = MOCK_RESPONSES[case.id]
632 |         for k, v in payload.items(): setattr(self, k, v)
633 |
634 | results = []
635 | for case in golden_cases:
636 |     fake = _FakeResult(MOCK_RESPONSES[case.id])
637 |     with patch.object(llm_mod, "get_llm_client") as mock_get:
638 |         # NL2SQLAgent calls get_llm_client().invoke(...); return fake regardless of args
639 |         mock_get.return_value.invoke = AsyncMock(return_value=fake)
640 |         agent = NL2SQLAgent(AgentConfig(model_name="test"))
641 |         agent_result = await agent.execute(query=case.nl_query, tenant_id="default")
642 |         results.append(evaluate_case(case, agent_result.output.get("sql", "")))
643 |
644 | # Enforce the real threshold IN pytest, not just __main__:
645 | suite_accuracy = sum(r.passed for r in results) / len(results) * 100
646 | assert suite_accuracy >= 90.0, f"NL2SQL accuracy {suite_accuracy:.1f}% < 90% threshold"
647 |
648 | This mocks the **LLM transport** only – the agent's prompt-building,
649 | JSON-parsing, destructive-pattern checking, and the full scoring pipeline all
650 | run for real.
651 |
652 | ** Gotcha – fix the broken fixture too.** `tests/fixtures/llm_mock.py` has
653 | `import json` at line 247 (last line) but calls `json.dumps` at lines 92-168 →
654 | `UnboundLocalError` on import; `create_mock_llm_client` (':206-243') has a
655 | `pass` loop body so it registers no scenarios. The clean approach is to either
656 | (a) fix `llm_mock.py` (move `import json` to top, implement the loop) and use
657 | it here, or (b) delete it and use the inline `AsyncMock` pattern above. Option
658 | (a) is preferred so other agent tests can reuse it.
659 |
660 | **Done when:** `test_full_suite_accuracy` fails if `MOCK_RESPONSES[case.id].parsed.sql`
661 | is mutated to be wrong for any case; the pytest run (not just `__main__`)
662 | enforces the 90% bar; CI's `eval-gate` job
663 | (`ci.yml:180-217`) actually blocks a merge on quality.
664 |
665 | ---
666 |
667 | ### Sequencing recommendation
668 |
669 | Tasks have no hard ordering dependency, but the lowest-risk high-impact order is:
670 |
671 | 1. **Task 2** (RLS + JWT) – pure infrastructure/config, no runtime behavior change.
672 | 2. **Task 1** (masking + observability) – small, additive, fulfills two guarantees at once.
673 | 3. **Task 3** (llm_client routing) – touches the hot path; pair with an integration check.
674 | 4. **Task 4** (eval rewrite) – test-only; do last so the new gate can guard the others.
675 |
676 | Each task should be its own commit/PR. Run `uv run pytest tests/ -v -m "not e2e"`
677 | after each.
678 |
679 | ---
680 |
681 | ## Phase 7 – Build & Test Verification (new)
682 |
683 | > **Added:** 2026-08-06. Phases 5b and 6 were implemented and statically verified
684 | > (all files parse, integration points traced by hand), but the two things that
685 | > require a live environment were NOT executed: the test suite and the Docker
686 | > build (including the custom AGE image). These tasks close that loop. They are
687 | > verification/validation work, not new features.
688 |
689 | | # | Task | Severity | Status |
690 | |---|---|---|---|
691 | | 1 | Run the backend test suite for real; fix what fails | High | |
692 | | 2 | Build the stack via `make setup`; fix the AGE image + any boot failures | High | |
693 | | 3 | Run `make verify` green end-to-end on a clean provision | Medium | |
694 | | 4 | Add a CI job that builds the custom Postgres image | Medium | |
695 | | 5 | Closeout: flip Phase 5b + Phase 6 from UNVERIFIED → verified | Medium | |
696 |
697 | ---
698 |
699 | ### Task 1 – Run the test suite for real and remediate failures
700 |
701 | **Why it matters:** Phase 6 changed load-bearing code – the golden eval now
702 | invokes `NL2SQLAgent` (was tautological), `ChartGenAgent` routes through
703 | `llm_client`, and the connector gained a tenant GUC. None of it has actually
704 | been executed. "It parses" ≠ "it works."
705 |
706 | **How to run:**
707 | ```bash
708 | make setup # provisions the stack
709 | docker compose -f infra/docker-compose.dev.yml exec backend \
710 |   uv run pytest tests/ -v -m "not e2e" --tb=short
711 | ```
712 | Or locally without Docker (faster iteration):
713 | ```bash
714 | cd backend && uv sync --dev
715 | uv run pytest tests/ -v -m "not e2e" --tb=short
716 | uv run pytest tests/evals/ -v # the rewritten gate
717 | ```
718 |
719 | **Known risks to watch for (traced, not yet confirmed):**
720 |
721 | 1. **pytest-asyncio collection of the new async class methods.**
722 |   `test_nl2sql_eval.py`'s `TestEvalSuite.test_full_suite_accuracy` and
723 |   `test_suite_detects_corrupted_mock` are `async def` methods on a plain
724 |   class. `asyncio_mode = "auto"` (pyproject.toml) auto-marks free async
725 |   functions, but **class-based async tests may need an explicit marker or a
726 |   `pytest_asyncio.fixture`** depending on the pytest-asyncio version. If they

```

```

727 | show as skipped/errored with "coroutine never awaited", add
728 | `@pytest.mark.asyncio` to the class or convert to module-level async
729 | functions. Verify first – don't assume.
730 |
731 | 2. The golden eval imports `NL2SQLAgent` which imports `langchain_anthropic`
732 | at module load** (`nl2sql_agent.py:16`). If `uv sync --dev` didn't install
733 | it (it's in base deps, should be fine), collection errors. Confirm
734 | `langchain-anthropic>=0.3` resolves.
735 |
736 | 3. load_prompt("nl2sql-system")` path resolution at test time.**
737 | `llm_client.load_prompt` computes the path as
738 | `Path(__file__).parent.parent.parent.parent / ".claude" / "prompts"`
739 | (`llm_client.py:327`). From `backend/app/core/llm_client.py` that's
740 | `does not exist. The prompt returns `""` and
743 | tests still pass (agent builds its own user message), but it's a latent bug
744 | for runtime. File as a follow-up: make the prompt path configurable via
745 | `settings` (e.g. `PROMPT_DIR`) with a container-aware default.
746 |
747 | 4. CI uses stock `pgvector/pgvector:pg16` – no AGE** (`ci.yml` services
748 | block). Any test that touches `graph_schema` / AGE will fail in CI even if
749 | it passes locally with the custom image. Either (a) skip AGE tests in CI
750 | with a marker, or (b) point CI at the custom image (Task 4). Decide which.
751 |
752 | 5. No Redis service in CI.** `cache.py` degrades gracefully (returns None),
753 | so cache-dependent tests should still pass – but the readiness probe test
754 | (if one exists) would report Redis unreachable. Confirm no test asserts
755 | `cache.set` then `cache.get` round-trips without Redis available.
756 |
757 | Scope rule: this task is `*run + fix failures*`. If a failure reveals a
758 | design issue (not a bug), write a new Phase 7 task for it rather than
759 | expanding scope here.
760 |
761 | Done when: `uv run pytest tests/ -v -m "not e2e"` exits 0 locally AND in
762 | CI, with the golden eval (`tests/evals/`) green and `test_suite_detects_corrupted_mock`
763 | proving the gate can fail.
764 |
765 | ---
766 |
767 | Task 2 – Build the stack via `make setup`; fix the AGE image + boot failures
768 |
769 | Why it matters: The #1 blocker from the original review was that the
770 | platform could not boot. Phase 5b wrote the provisioning, but none of it has
771 | been built. The custom AGE image is the highest-risk component (compiles AGE
772 | from source against PG16 headers).
773 |
774 | How to run:
775 | ```bash
776 | make setup      # or, to isolate the image build:
777 | docker compose -f infra/docker-compose.dev.yml build postgres
778 | ```
779 |
780 | Known risks to watch for:
781 |
782 | 1. AGE PG16 branch build failures (highest risk).**
783 | `infra/postgres/Dockerfile` clones `--branch PG16` from `apache/age` and
784 | runs `make PG_CONFIG=.../pg_config install`. AGE's PG16 support has
785 | historically lagged behind PG releases and occasionally needs:
786 | - A specific AGE release tag instead of `HEAD` of the branch (pin a tag
787 |   like `v1.5.0` if `PG16` branch HEAD is broken).
788 | - The PG server compiled with `--with-llvm` (the pgvector image already
789 |   has LLVM, but verify `llvm-dev`/`clang` are the versions AGE expects).
790 | - `llvm15` specifically on older Alpine (PG16 bundles LLVM 16; mismatched
791 |   `llvm-dev` causes link errors).
792 | If the build fails, the fix is usually: pin the AGE tag, and match the
793 | `llvm-dev`/`clang` major version to what `pg_config --configure` reports.
794 |
795 | 2. CREATE EXTENSION age` requires superuser.**
796 | Docker's entrypoint makes `POSTGRES_USER` a superuser, so `genbi` can run
797 | `CREATE EXTENSION age` – but verify the `init.sql` guard's
798 | `pg_available_extensions` check actually sees AGE after the image build
799 | (a failed `.so` install would make AGE "available" per the catalog but
800 | unloadable). If the guard logs "AGE not available" despite the image
801 | building, the `.so` didn't land in `pkglibdir`.
802 |
803 | 3. gen-env.sh` Fernet dependency.** The script calls
804 | `python3 -c "from cryptography.fernet import Fernet..."` – if `cryptography`
805 | isn't installed on the host, it falls back to a raw base64 key, which is
806 | fine but worth confirming the fallback branch works (I wrote it
807 | defensively; it hasn't run).
808 |
809 | 4. uv/pnpm lockfile generation in `setup.sh`.** The script runs `uv lock`
810 | and `pnpm install --lockfile-only` if lockfiles are missing, then warns to
811 | commit them. Confirm the generated `backend/uv.lock` actually satisfies
812 | `uv sync --frozen` in the Dockerfile (the whole point of Task 3's
813 | Dockerfile change).
814 |
815 | 5. Alembic stamp path.** `setup.sh` runs
816 | `alembic stamp 0001_baseline` inside the backend container. Verify the
817 | `alembic.ini` `script_location` = `app/db/migrations` resolves from
818 | `WORKDIR /app` – should be fine, but a wrong cwd produces a silent "alembic
819 | not available" fallback message.
820 |
821 | Done when: `make setup` completes, `docker compose ps` shows every service
822 | (healthy), and the AGE graph check in `verify.sh` reports
823 | `genbi_graph` exists (or the graceful "AGE not available" warning if AGE is
824 | disabled).
825 |
826 | ---
827 |
828 | Task 3 – `make verify` green on a clean provision
829 |
830 | Why it matters: `verify.sh` is the acceptance gate for the whole
831 | provisioning effort. It checks all 7 wires (backend liveness/readiness, Cube,

```

```

832 Redis, Postgres seed+AGE, frontend, Prometheus). Getting it green proves the
833 platform is actually up, not just that containers started.
834
835 **How to run:** `make verify` (after Task 2).
836
837 **Known risks:** This task is mostly "run it and triage." The most likely
838 failure is the **backend readiness probe returning 503** – it now does real
839 `SELECT 1` + Redis ping. If the backend boots before migrations complete (the
840 `start_period: 30s` healthcheck should cover this, but verify), readiness will
841 flap. Second likely failure: **Cube** – its healthcheck uses `wget` which may
842 not exist in `cubejs/cube:latest`; if so, switch to `curl` or a TCP check.
843
844 **Done when:** `make verify` prints all and exits 0 on a machine that just
845 ran `make setup` from clean.
846
847 ---
848
849 ### Task 4 – CI builds the custom Postgres image
850
851 **Why it matters:** CI currently uses `pgvector/pgvector:pg16` as the test DB
852 service (`ci.yml`). After Phase 5b, the project's own schema (`init.sql`)
853 runs `CREATE EXTENSION age` (guarded, so it won't crash – but AGE-dependent
854 code paths are unstable in CI). Also: the custom image itself has no CI
855 coverage, so an AGE upstream breakage ships green.
856
857 **Deliverable:**
858 - Add a `postgres-image` job to `.github/workflows/ci.yml` that builds
859 `infra/postgres/Dockerfile` and pushes to the registry (or just builds to
860 validate it compiles on every PR).
861 - Point the `backend-lint-test` job's `services.postgres.image` at the custom
862 image (either the registry tag from the build job, or build it inline via
863 a `docker build` step before the services block – GitHub Actions services
864 can't `build:`, so you need a pre-built tag or a different approach).
865 - Add a marker like `@pytest.mark.age` to AGE-dependent tests so they run in
866 CI once the image is available, and are skipped otherwise.
867
868 **GitHub Actions limitation:** the `services:` block only accepts
869 `image:`, not `build:`. Options: (a) build & push the image in a prior job
870 and reference the tag, (b) use a `docker-compose`-based service setup instead
871 of the `services:` block, or (c) keep CI on stock pgvector and accept that AGE
872 tests are local-only (mark them `@pytest.mark.age` + skip in CI). Option (c)
873 is the lowest-effort honest choice; (a) is the most correct.
874
875 **Done when:** CI builds the AGE image on every PR (failing the build if AGE
876 upstream breaks), and AGE-marked tests either run in CI or are explicitly
877 skipped with a documented reason.
878
879 ---
880
881 ### Task 5 – Closeout: flip Phase 5b + Phase 6 from UNVERIFIED → verified
882
883 **Why it matters:** Phase 5b and Phase 6 both carry a `STATUS: UNVERIFIED`
884 banner at the top. That banner is the source of truth for whether the work in
885 those phases can be relied on. It must not stay UNVERIFIED forever, and it must
886 not be flipped prematurely. This task is the single, explicit gate that moves
887 the status – it is NOT done automatically by Tasks 1-4, because status is a
888 human-confirmed declaration, not a side effect.
889
890 **Entry criteria (ALL must be met before flipping):**
891 1. Task 1 complete – `uv run pytest tests/ -v -m "not e2e"` and
892 `uv run pytest tests/evals/` both exit 0, locally and in CI.
893 2. Task 2 complete – `make setup` builds the stack including the custom AGE
894 image; `docker compose ps` shows every service `(healthy)`.
895 3. Task 3 complete – `make verify` prints all and exits 0 on a clean
896 provision.
897 4. Task 4 complete (or explicitly deferred with rationale) – CI builds the
898 custom Postgres image, and AGE-marked tests are either running or
899 documented-skipped.
900
901 **The edit:**
902 - Remove the `STATUS: UNVERIFIED` blockquote from the Phase 5b header
903 (lines ~103-107) and the Phase 6 header (lines ~413-417).
904 - Replace each with a `STATUS: VERIFIED` line citing the date and the
905 Phase 7 task numbers that closed it, e.g.:
906 `> STATUS: VERIFIED 2026-08-XX. Closed by Phase 7 Tasks 1-3.`
907 - Mark Task 5 in the Phase 7 table.
908
909 **Anti-scope:** if any of Tasks 1-4 surfaced a new bug that was filed as a
910 follow-up task (rather than fixed inline), the status flip may proceed **only
911 if **the follow-ups are non-blocking for the core guarantees those phases
912 claim (RLS enforced, masking wired, eval gate real, stack boots). Blocking
913 follow-ups must be resolved first.
914
915 **Done when:** both phase headers read `STATUS: VERIFIED` with a date and
916 citation, and Task 5 is .
917
918 ---
919
920 ### Sequencing
921
922 1. **Task 2 first** (build the image + boot the stack) – because Task 1's test
923 run benefits from a working environment, and Task 3 depends on the stack
924 being up.
925 2. **Task 1** (run tests, fix failures) – against the now-bootable stack.
926 3. **Task 3** (verify green) – once tests pass and the stack is stable.
927 4. **Task 4** (CI image) – hardens the pipeline so regressions are caught
928 before merge, not at the next provision.
929 5. **Task 5** (closeout) – the final, explicit gate. Run only after 1-4 are
930 (or 4 is documented-deferred). This is what flips Phases 5b and 6 from
931 UNVERIFIED to VERIFIED – nothing else does.
932
933 These five tasks convert "implemented and statically checked" into "verified
934 working." Until Task 5 is , treat Phases 5b/6 as **unverified** – the code
935 is written carefully but has never executed.
936

```

```

937| ---
938|
939| ## Phase 8 – Auth & Chat Completion (Tasks 31-37)
940|
941| > **Status: VERIFIED 2026-08-14** – closes the product's missing login path
942| > end-to-end and repairs the never-green lint gates.
943|
944| | # | Task | Status |
945| |---|---|---|
946| | 31 | Password hashing (bcrypt) + `POST /auth/login` (JWT minting, tenant disambiguation) | |
947| | 32 | Dev bootstrap user seed (`init.sql`: `admin@genbi.local`) + README demo credentials | |
948| | 33 | Auth tests: `security.py` unit tests + DB-backed login integration tests (skip when Postgres down) | |
949| | 34 | Frontend auth slice: `/login` page, `/chat` route, `AuthGuard` redirect, landing page, `LoginForm` extraction | |
950| | 35 | Fix token storage key mismatch (`auth-storage.ts`); api-client previously read the wrong localStorage key | |
951| | 36 | Repair never-green frontend gates: commit `pnpm-lock.yaml`, ESLint flat config (`eslint .`), shadcn dangling re-export cleanup | |
952| | 37 | Repair backend lint gate (ruff `extend` path + 136 pre-existing violations) + docs refresh + `verify.sh` login check | |
953|
954| ### Verified by
955|
956| - `ruff check .` + `ruff format --check .` – clean (backend)
957| - `pytest -m "not e2e"` – 61 passed, 6 skipped (DB-backed auth tests skip without Postgres; run in CI)
958| - `pnpm typecheck` / `pnpm lint` / `pnpm build` – clean (standalone trace fails only on local non-symlink filesystems)
959| - `make verify` now includes an auth login smoke check
960|
961| ### Follow-ups (out of scope, flagged)
962|
963| - **RLS tenant isolation is not enforced**: the app connects as `POSTGRES_USER`
964|   (a superuser in the official image), so `FORCE ROW LEVEL SECURITY` policies
965|   never constrain it. Fix: dedicated non-superuser `genbi_app` role + grants +
966|   connector auth swap. The login request already supports optional `tenant_id`
967|   for that migration.
968| - `graph_schema.py` builds AGE Cypher with f-string interpolation – parameterize
969|   (AGE `$params` jsonb arg) as part of the RLS work.
970|
971| ---
972|
973| ## Phase 8b – Enforced Tenant Isolation (Tasks 38-44)
974|
975| > **Status: code complete 2026-08-15; runtime verification pending a Docker
976| > session (`make reset && make setup && make verify`).** Closes the gap where
977| > RLS was configured but never enforced (the app connected as a superuser).
978|
979| | # | Task | Status |
980| |---|---|---|
981| | 38 | Alembic 0002: `genbi_app` + `genbi_auth` roles, grants, `users_login_lookup` policy (mirrored in init.sql) | |
982| | 39 | Alembic 0003: analytics tables under FORCE RLS; seed `users` → `web_users` rename (collision fix) | |
983| | 40 | Runtime switch: `DATABASE_URL` → `genbi_app`, new `DATABASE_URL_AUTH` engine for login (`get_auth_db`) | |
984| | 41 | Admin scripts repair: `db_admin.py` owner connections + tenant GUC; seed/embed rewrite (both were broken through the read-only connector) | |
985| | 42 | Isolation tests: cross-tenant invisibility, forged-tenant INSERT rejection, no-GUC blindness, genbi_auth carve-out bounds (8 tests) | |
986| | 43 | `verify.sh`: RLS enforcement checks (genbi_app sees 0 users w/o GUC; genbi_auth users-only) | |
987| | 44 | Docs: ADR 006, README roles table + upgrade path | |
988|
989| ### Verified by
990|
991| - ruff + full pytest locally (DB-backed tests skip without Postgres; they run
992|   in CI where the migration step creates the roles)
993| - CI exercises: migrations (0002+0003) → auth + isolation suites against the
994|   real roles
995| - Pending (needs Docker): `make reset && make setup && make verify`,
996|   login smoke via the genbi_auth path
997|
998| ### Notes / follow-ups
999|
1000| - The AGE lineage module (`graph_schema.py`) remains dead code with
1001|   f-string-interpolated Cypher – parameterize before wiring it to the
1002|   runtime role.
1003| - Login rate limiting (protects the genbi_auth cross-tenant read oracle) is
1004|   an app-layer follow-up.
1005| - Writing to tenant tables through the ORM requires setting the GUC on the
1006|   session – copy the `set_tenant_guc` pattern when the first ORM writer
1007|   (audit_log) lands.
1008|
1009| ---
1010|
1011| ## Phase 9 – Real Semantic Layer: Cube-Native Catalog (Tasks 45-50)
1012|
1013| > **Status: code complete 2026-08-15; live Cube boot pending a Docker
1014| > session (`make reset && make setup && make verify` – as with 8b).**
1015| > ADR 007 documents the pivot: the dbt tier was unrunnable scaffold (no dbt
1016| > toolchain, Cloud-only bridge, invalid YAML) – Cube-native data models are
1017| > now the single source of truth.
1018|
1019| | # | Task | Status |
1020| |---|---|---|
1021| | 45 | Catalog: `semantic/cube/schema/` – 10 cubes / 23 measures over the seeded tables, joins only on real FKs, tenant_id dimension everywhere | |
1022| | 46 | Runtime wiring: cube.js rewrite (real CUBEJS_DB_* driver env, cube_reader role), compose mount `/cube/conf`, node-fetch healthcheck, gen-env.sh
1023| | 47 | CubeClient fixes: JWT auth (was raw secret), raw-/meta cache + re-parse (was silently dropping parsed metrics), get_agent_context keyword ranki
1024| | 48 | `GET /metrics/list` real implementation (503 CUBE_UNAVAILABLE); `/metrics/query` explicitly deferred to Phase 10 (needs per-tenant Cube GUC dri
1025| | 49 | Tests: catalog structural validation (9), client fixes (7), API list endpoint (3) – all offline | |
1026| | 50 | Cleanup/docs: delete `semantic/dbt/`, ADR 007, rewrite semantic README + docs, README refresh | |
1027|
1028| ### Verified by
1029|
1030| - ruff clean; full suite: **82 passed, 14 skipped** (21 new tests; skips are
1031|   the DB-backed 8b suites that run in CI)
1032| - Catalog tests parse every schema YAML and enforce invariants (unique
1033|   names, symmetric joins, tenant dims, core metrics)
1034| - Fixed latent CI bug found via new tests: error-shape assertions in
1035|   `test_auth.py` expected top-level `code` (FastAPI nests under `detail`)
1036|
1037| ### Deferred to Phase 10 (with /metrics/query + Explore)
1038|

```

```

1039 | - Per-tenant Cube data path: `contextToOrchestratorId` + connection-init
1040 |   `set_config('app.current_tenant_id', ...)` in the cube_reader driver
1041 | - `retrieve_schema_context` pgvector wiring in NL2SQLAgent (stub returns [])
1042 | - `scripts/embed_schema.py` uses an unverified embedding model
1043 |   (`claude-embeddings-20250219`) – validate before relying on it
1044 |
1045 | ---
1046 |
1047 | ## Phase 10 – Metrics + Explore: Tenant-Scoped Cube Data (Tasks 51-56)
1048 |
1049 | > **Status: code complete 2026-08-15; live chain (JWT→Cube→GUC→RLS) verified
1050 | > in code/CI mocks, live confirmation pending a Docker session via the new
1051 | > `make verify` metric-query check.** ADR 008 documents the design; the
1052 | > failure mode is closed (misconfiguration zero rows, never cross-tenant).
1053 |
1054 | | # | Task | Status |
1055 | |---|---|---|
1056 | | 51 | Per-tenant Cube data path: `tenantId` JWT claim → `contextToOrchestratorId` → driverFactory pg `options` GUC (`semantic/cube/cube.js`) | |
1057 | | 52 | CubeClient: per-tenant token cache, `query(tenant_id=...)`, metric_key no-op fix; first-ever query() tests | |
1058 | | 53 | `POST /metrics/query` real (catalog validation 400, 503 CUBE_UNAVAILABLE, tenant-scoped, 300s two-tier cache keyed on canonical query) | |
1059 | | 54 | `GET /datasources` real (cubes from /meta); `/datasources/test` stays a documented stub (different feature) | |
1060 | | 55 | Explore page: catalog cards, native-select query builder, results table, ChartCard via /charts/render; chat header toggle now navigates to /explore (was dead state) | |
1061 | | 56 | `verify.sh`: live tenant-scoped metric query check (login → query → expect non-empty rows) | |
1062 |
1063 | ### Verified by
1064 |
1065 | - Backend: 17 new tests (tenant tokens, query() shape/flattening/total,
1066 |   API happy/tenant-threading/cache-hit/400/503/422/auth, datasources) –
1067 |   full suite green, ruff clean
1068 | - Frontend: typecheck + lint clean, build compiles all 7 pages (explore
1069 |   included)
1070 | - Pending live (Docker): `make verify` metric-query check proves the whole
1071 |   JWT→securityContext→per-tenant-driver→GUC→RLS chain end-to-end
1072 |
1073 | ### Follow-ups
1074 |
1075 | - Safety hardening (EXPLAIN-backed validation, >1M-row confirm,
1076 |   tests/services) and the small bundle (login rate limiting, audit_log
1077 |   writer, retrieve_schema_context pgvector wiring, embedding-model
1078 |   validation) remain queued.
1079 |
1080 | ---
1081 |
1082 | ## Phase 11 – NL2SQL Context Wiring (Tasks 57-61)
1083 |
1084 | > **Status: code complete 2026-08-15.** Closes the core-loop gap: the NL2SQL
1085 | > agent generated SQL with ZERO schema context and ZERO few-shot examples
1086 | > (both retrieval stubs returned [] and nothing called them – invisible to
1087 | > the golden eval because it mocks the LLM).
1088 |
1089 | | # | Task | Status |
1090 | |---|---|---|
1091 | | 57 | Embedding provider: `app/core/embeddings.py` (OpenAI text-embedding-3-small – 1536 dims match VECTOR(1536); the Anthropic embeddings call targeted a nonexistent API). Config: OPENAI_API_KEY/EMBEDDING_MODEL/EMBEDDING_DIMS + env templates | |
1092 | | 58 | Retrieval service: `app/services/schema_retrieval.py` – pgvector cosine top-k on schema_embeddings + agent_examples via the RLS-bound connector (tenant GUC); fail-open everywhere | |
1093 | | 59 | ChatService wiring: schema context (get/set_schema_context, TTL 86400 – previously unused methods) + few-shot (new cache methods, TTL 3600) flow into agent.execute | |
1094 | | 60 | embed_schema.py: shared embedding provider, cache invalidation after sync, `--examples` golden-set seeding (20 NL/SQL pairs → agent_examples, idempotent); prompt touch-up (dbt → Cube.dev) | |
1095 | | 61 | Tests: 13 new (provider dims/errors, retrieval contract/tenant-scoping/fail-open, service wiring incl. cache-hit and degradation paths) | |
1096 |
1097 | ### Verified by
1098 |
1099 | - 13 new tests; full suite green; ruff clean
1100 | - Ops flow: `PYTHONPATH=backend uv run python scripts/embed_schema.py --examples`
1101 |   arms both retrieval sources (needs OPENAI_API_KEY), then invalidates cache
1102 |
1103 | ### Remaining roadmap
1104 |
1105 | - Governance completion (audit_log writer + login rate limiting)
1106 | - Validation hardening (EXPLAIN-backed gate, >1M-row confirm, pipeline tests)
1107 | - ivfflat index on agent_examples if the example set grows
1108 |
1109 | ---
1110 |
1111 | ## Phase 12 – Governance Completion (Tasks 62-66)
1112 |
1113 | > **Status: code complete 2026-08-15.** Closes the README's "audit tracing"
1114 | > headline claim (the audit_log table existed but nothing wrote to it) and
1115 | > throttles the genbi_auth login oracle.
1116 |
1117 | | # | Task | Status |
1118 | |---|---|---|
1119 | | 62 | Audit writer via the LLMClient callback hook (the documented "every LLM call" contract): `app/services/audit.py` – asyncpg on genbi_app + tenant GUC, parameterized INSERT, non-UUID rows skipped, fail-open; wired in `create_app()` | |
1120 | | 63 | `_audit()` fix: input_prompt_hash now SHA-256 of the actual prompt (was model+tokens) | |
1121 | | 64 | Login rate limiting: Redis INCR counter per normalized email (5 failures / 900s → 429 TOO_MANY_ATTEMPTS, reset on success, fail-open without Redis); every 401 path registers | |
1122 | | 65 | verify.sh: fixed Phase 10 ordering bug (login check ran AFTER the metric check consuming its token – the check always silently skipped); audit-trail info check | |
1123 | | 66 | Tests: 19 across audit writer (GUC+insert contract, UUID skip, fail-open), prompt-hash fix, limiter (threshold/TTL/reset/fail-open), 429 endpoint paths | |
1124 |
1125 | ### Verified by
1126 |
1127 | - 19 new service tests; ruff clean; full suite green
1128 | - CI safety: test_auth accumulates only 3 failed logins on its shared email
1129 |   (verified) – under the 5-failure threshold
1130 | - Pending live (Docker): audit rows after one chat query; 429 after 5 bad logins
1131 |
1132 | ### Remaining roadmap (Phase 13 candidate)
1133 |
1134 | - Validation hardening: EXPLAIN-backed SQL gate (connector's explain() is

```

```

1135 | implemented but unused), >1M-row confirmation, chat-pipeline tests
1136 |
1137 | ---
1138 |
1139 | ## Phase 13 – Validation Hardening (Tasks 67–70)
1140 |
1141 | > **Status: code complete 2026-08-15.** The final planned phase – completes
1142 | > the original roadmap at 70/70 tasks. The SQL safety gate is now
1143 | > EXPLAIN-backed and the >1M-row confirmation contract is real end-to-end.
1144 |
1145 | | # | Task | Status |
1146 | |---|---|---|
1147 | | 67 | EXPLAIN wiring: ValidationAgent `connector` kwarg (protected file – pure strengthening), real row estimates + plan text, fail-open both layers;
1148 | | ChatService passes a short-lived RLS-scoped connector | |
1149 | | 68 | Confirmation contract: `_step_validate` → dict return; gate in sync + stream paths stops before execution until `confirm_large_query: true`; Ch
1150 | | atRequest/ChatResponse fields; SSE `validation` payload + `done` status `confirmation_required` | |
1151 | | 69 | Frontend: confirm panel ("Confirm and run" re-sends with the flag), schemas extended; fixed a latent onClick-arg bug in handleSend exposed by t
1152 | | he new signature | |
1153 | | 70 | Tests: 13 new – agent+fake connector (estimates flow, >1M flags, EXPLAIN error fails open, destructive SQL never EXPLAINed) + full pipeline orc
1154 | | hestration (sync happy/no_sql/validation_failed/confirm-block-then-proceed; stream event order/confirmation_required/confirmed-resend) | |
1155 |
1156 | ### Verified by
1157 |
1158 | - 133 passed / 14 skipped (13 new); ruff clean; frontend typecheck/lint clean
1159 | - Orchestration tests run the REAL deterministic ValidationAgent with only
1160 | LLM agents mocked – the confirmation gate is exercised end-to-end
1161 | - Doc debt fixed: agent-system.md stale checks table (is_valid key,
1162 | timeout-injection claim, pattern counts), openapi.yaml fields, CLAUDE.md
1163 | protected-file paths (validation agent + dbt-era metrics path)
1164 |
1165 | ### Roadmap status: COMPLETE (70/70)
1166 |
1167 | Future candidates (new roadmap): conversation persistence + multi-turn
1168 | chat (conversations table still unwritten), reports/dashboards build-out,
1169 | AGE lineage wiring, feedback API (feedback_score column), per-role
1170 | validation permissions (user_roles plumbing exists, unused).
1171 |
1172 | ---
1173 |
1174 | ## Phase 14 – Conversations & Multi-Turn Chat (Tasks 71–75)
1175 |
1176 | > **Status: code complete 2026-08-15.** The chat product finally has memory:
1177 | > conversations persist, history feeds the NL2SQL prompt, and the UI lists
1178 | > and resumes threads.
1179 |
1180 | | # | Task | Status |
1181 | |---|---|---|
1182 | | 71 | Alembic 0004_messages: messages table (RLS FORCE + tenant_isolation + genbi_app grants) mirrored in init.sql; ORM Message model | |
1183 | | 72 | `app/services/conversations.py`: create/list/append via asyncpg on genbi_app + tenant GUC (Phase 12 pattern); per-user scoping predicate; fail-
1184 | | open writes, raise-on-read | |
1185 | | 73 | `GET /conversations` + `GET /conversations/{id}/messages` (JWT-scoped; 400/503 paths); SSE `start` event now carries conversation_id | |
1186 | | 74 | History injection: ChatService resolves/creates the conversation, loads last 6 turns into the NL2SQL prompt ("## Conversation History" section)
1187 | | , persists user + assistant turns at every pipeline exit (both modes) | |
1188 | | 75 | Frontend: conversations sidebar (list, new-chat, active highlight), replay-on-select, send carries conversation_id; 18 new backend tests (servi
1189 | | ce contract, endpoints, agent prompt section, wiring incl. fail-open paths) | |
1190 |
1191 | ### Verified by
1192 |
1193 | - 151 passed / 14 skipped (18 new); ruff clean; frontend typecheck/lint clean
1194 | - Pipeline tests extended to mock conversation persistence (fail-open held –
1195 | the earlier unmocked run passed, just slowly)
1196 | - Live behavior (Docker session): send two follow-up questions in one
1197 | conversation; sidebar lists/resumes threads
1198 |
1199 | ### Follow-ups
1200 |
1201 | - Message pagination UI (limit param exists), conversation rename/delete,
1202 | - reports/dashboards build-out; feedback API; AGE wiring (unchanged queue)
1203 |
1204 | ---
1205 |
1206 | ## Phase 15 – Governance Bundle (Tasks 76–78)
1207 |
1208 | > **Status: code complete 2026-08-15.** Three quick governance wins: feedback
1209 | > loop, role-based query policy, and AGE lineage parameterization.
1210 |
1211 | | # | Task | Status |
1212 | |---|---|---|
1213 | | 76 | Feedback API: `POST /chat/feedback` (session_id + score -1/0/+1) → `audit_log.feedback_score` via the GUC writer pattern (updates all rows of t
1214 | | he session); 503 FEEDBACK_UNAVAILABLE on failure | |
1215 | | 77 | Per-role validation: ValidationAgent `_check_role_restrictions` – QUERY_ROLES gate (admin/analyst/user/viewer; unrecognized roles hard-rejected
1216 | | ), viewer role restricted to single-table lookups (JOIN/UNION/CTE rejected); empty roles unrestricted (connector + RLS remain the hard gates) | |
1217 | | 78 | AGE lineage parameterized: all cypher in graph_schema.py converted from f-string interpolation to inline literals + AGE `$name` parameters boun
1218 | | d via the third `ag_catalog.cypher` argument; no behavior change (module still has zero callers – wiring is future work) | |
1219 |
1220 | ### Verified by
1221 |
1222 | - 160 passed / 14 skipped (9 new tests: role matrix, feedback happy/503/422/auth);
1223 | ruff clean; frontend untouched
1224 | - Live (Docker session): thumbs-up a chat response then check
1225 | `SELECT feedback_score FROM audit_log`; AGE statements exercise on `make
1226 | reset` (init graph path)
1227 |
1228 | ### Follow-ups
1229 |
1230 | - Frontend thumbs up/down buttons on assistant messages (writes via the new
1231 | endpoint) – small UI addition, deferred
1232 | - AGE sync scheduler (`sync_semantic_layer_to_graph` still has no caller)
1233 |
1234 | ---
1235 |
1236 | ## Phase 16 – Reports & Dashboards: The Capstone (Tasks 79–84)
1237 |
1238 | > **Status: code complete 2026-08-15.** The last original-scaffold stub is
1239 | > real: multi-chart reports from natural language, persisted and browsable.

```

```

1230 |
1231 | # | Task | Status |
1232 |---|---|---|
1233 | 79 | Alembic 0005_reports: reports + report_sections tables (RLS FORCE + tenant_isolation + genbi_app grants + indexes), init.sql mirror, ORM models
1234 | |
1235 | 80 | Report service (`app/services/reports.py`): LLM-planned pipeline (2 LLM calls/report – planner over the metric catalog at temp 0 + one summary
1236 | call), deterministic per-section execution (tenant-scoped Cube query → ChartAssemblyInput → FlintChartBridge SVG), per-section fail-open; persistence
1237 | via the conversations GUC-writer pattern (writes fail-open, reads raise) | |
1238 | 81 | API: POST /reports/generate (full report incl. sections), GET /reports (list, declared before /{id}), GET /reports/{report_id} (400/404/503 pat
1239 | hs) | |
1240 | 82 | New prompt `.claude/prompts/report-planner-system.md` (JSON contract: title + sections with exact catalog metric names, dimension/granularity r
1241 | ules) | |
1242 | 83 | Frontend /reports page: prompt box + section-count select + Generate; sidebar list of past reports; report rendering with per-section ChartCard
1243 | s (reusing the chart stack, no new deps); chat header FileText nav | |
1244 | 84 | Tests: 21 new (12 service – planner sanitization, deterministic chart specs, happy path with tenant-threading + total computation, partial fail
1245 | ure, persistence-failure warning, GUC+insert contract, fail-open; 9 API – generate/list/get matrix) | |
1246 |
1247 | ### Verified by
1248 |
1249 | - 181 passed / 14 skipped (21 new); ruff clean; frontend typecheck/lint clean;
1250 | build compiles all 8 pages (reports included); chain verified → 0005_reports
1251 | - Live (Docker session): generate "Q3 revenue and pipeline report", view it
1252 | from the list, re-open it after reload (persistence)
1253 |
1254 | ### Follow-ups
1255 |
1256 | - `/dashboards` frontend dir still empty (report list is the surface for now)
1257 | - Scheduled/regenerating reports, PDF export, dashboard pinning, AGE
1258 | DASHBOARD_USES lineage wiring – unchanged queue

```

1 | # GenBI – Verification Checklist (Phase 7 Tasks 1-3)
2 |
3 | > Run this on a machine with Docker, `uv`, and `pnpm` installed.
4 | > These tasks convert the Phase 5b/6 work from "written + statically checked"
5 | > to "verified working." Report failures back so they can be fixed.
6 | >
7 | > Expected total time: ~20-40 min (dominated by the AGE image build).
8 |
9 | ## Task 2 – Build the stack (do this FIRST)
10 |
11 | ```bash
12 | make setup
13 | ```
14 |
15 | **What it does:** prereq check → gen `.env` → install deps → build images →
16 | start infra → migrate → start full stack → verify.
17 |
18 | ### Watch for
19 |
20 | | # | Risk | Symptom | Fix |
21 | |---|---|---|---|
22 | | 1 | **AGE PG16 build fails** (highest risk) | `make setup` fails during `docker compose build` with a compile error in the AGE step | Pin an AGE rel
23 | ease tag in `infra/postgres/Dockerfile` (`--branch PG16` → `--branch v1.5.0` or similar). May also need to match `llvm-dev`/`clang` major version to P
24 | G16's bundled LLVM. |
25 | | 2 | `CREATE EXTENSION age` denied | `init.sql` logs "AGE not available" despite image building | Confirm the `.so` landed: `docker run --rm genbi/po
26 | stgres-pgvector-age:pg16 pg_config --pglibdir` then check `age.so` exists there. |
27 | | 3 | `gen-env.sh` Fernet fallback | Warning about cryptography, or key looks wrong | Ensure `cryptography` is installed on host (`pip install cryptog
28 | raphy`), or accept the base64 fallback (works, just less standard). |
29 | | 4 | `uv.lock` / `pnpm-lock.yaml` missing | `setup.sh` prints "Generated ... – commit it" | Commit the lockfiles after generation so `--frozen` builds wo
30 | rk next time. |
31 | | 5 | Alembic stamp fails | "alembic not yet available" warning | Confirm `backend/alembic.ini` exists and `script_location = app/db/migrations` resol
32 | ves from `WORKDIR /app`. |
33 |
34 | ### Done when
35 | - `docker compose -f infra/docker-compose.dev.yml ps` shows every service.
36 | - The AGE image built successfully (or AGE is gracefully disabled with a logged notice).
37 |
38 | ---
39 |
40 | ## Task 1 – Run the test suite
41 |
42 | ```bash
43 | # Inside the running backend container (preferred – matches the runtime env):
44 | docker compose -f infra/docker-compose.dev.yml exec backend \
45 |   uv run pytest tests/ -v -m "not e2e" --tb=short
46 |
47 | # The golden eval gate specifically:
48 | docker compose -f infra/docker-compose.dev.yml exec backend \
49 |   uv run pytest tests/evals/ -v
50 |
51 | # Or locally without Docker (faster iteration, no DB/Redis needed for most tests):
52 | cd backend && uv sync --dev
53 | uv run pytest tests/ -v -m "not e2e" --tb=short
54 | ```
55 |
56 | ### Watch for
57 |
58 | | # | Risk | Symptom | Fix |
59 | |---|---|---|---|
60 | | 1 | **pytest-asyncio doesn't collect async class methods** | `TestEvalSuite.test_full_suite_accuracy` shows as skipped or errors with "coroutine nev
61 | er awaited" | Add `@pytest.mark.asyncio` to the class, OR convert the two methods to module-level async functions. Verify first – `asyncio_mode = "aut
62 | o"` may already handle it. |
63 | | 2 | `langchain_anthropic` import error at collection | ModuleNotFoundError during test collection | Confirm `uv sync --dev` installed it (it's in ba
64 | se deps, should be fine). |
65 | | 3 | `load_prompt` returns empty in container | Tests pass but NL2SQL system prompt is empty | Already fixed in commit `c68b888` – verify `/app.clau
66 | de/prompts/nl2sql-system.md` exists inside the container. |
67 | | 4 | AGE-dependent tests fail in CI | CI uses stock `pgvector/pgvector:pg16` (no AGE) | Mark AGE tests `@pytest.mark.age` and skip in CI, OR build th
68 | e custom image in CI (Phase 7 Task 4). |
69 | | 5 | Cache round-trip tests fail without Redis | `cache.set` then `cache.get` returns None | Expected – cache degrades to None without Redis. These t
70 | ests need Redis or should be skipped. |
71 |
72 | ### Done when
73 | - `pytest tests/ -v -m "not e2e"` exits 0.
74 | - `pytest tests/evals/` exits 0 (the rewritten golden gate passes).
75 | - `test_suite_detects_corrupted_mock` passes (proves the gate can fail).
76 |
77 | ---
78 |
79 | ## Task 3 – Smoke test
80 |
81 | ```bash
82 | make verify
83 | ```
84 |
85 | ### Watch for
86 |
87 | | # | Risk | Symptom | Fix |
88 | |---|---|---|---|
89 | | 1 | Backend readiness returns 503 | `/health/ready` reports database or redis unreachable | Backend likely booted before migrations finished – wait
90 | 30s and re-run. If persistent, check `make logs backend`. |
91 | | 2 | Cube healthcheck fails | `wget: command not found` in cube container | Switch the cube healthcheck to `curl` or a TCP check in `docker-compose.d
92 | ev.yml`. |
93 | | 3 | Frontend not served | HTTP 000 on `:3000` | Frontend takes longer to start; check `make logs frontend`. |
94 |
95 | ### Done when
96 | `make verify` prints all and exits 0.
97 |
98 | ---
99 |
100 | ## After verification

```

```
87|
88| - Report which tasks passed/failed, with any error output.
89| - If something failed and reveals a design issue (not a quick fix), add it as
90|   a new Phase 7 task in `todo.md` rather than expanding scope.
91| - Once Tasks 1-3 are green, the final step is Phase 7 Task 5: flip the
92|   `STATUS: UNVERIFIED` banners in Phase 5b/6 headers to `STATUS: VERIFIED`.
93|
94| ## Branches
95| - `main` - all Phase 5b/6 work committed
96| - `fix/load-prompt-container-path` - the `load_prompt` fix (Task 1 risk #3,
97|   pre-resolved); merge after verification or keep if it helps
```
